Responsive Flask/SQLAlchemy personal finance app, specifically for biweekly budgeting.

For full documentation, see <http://biweeklybudget.readthedocs.io/en/latest/>

For screenshots, see <http://biweeklybudget.readthedocs.io/en/latest/screenshots.html>

For development activity, see <https://waffle.io/jantman/biweeklybudget>

CHAPTER 1

Overview

biweeklybudget is a responsive (mobile-friendly) Flask/SQLAlchemy personal finance application, specifically targeted at budgeting on a biweekly basis. This is a personal project of mine, and really only intended for my personal use. If you find it helpful, great! But this is provided as-is; I'll happily accept pull requests if they don't mess things up for me, but I don't intend on working any feature requests or bug reports at this time. Sorry.

The main motivation for writing this is that I get paid every other Friday, and have for almost all of my professional life. I also essentially live paycheck-to-paycheck; what savings I have is earmarked for specific purposes, so I budget in periods identical to my pay periods. No existing financial software that I know of handles this, and many of them have thousands of Google results of people asking for it; almost everything existing budgets on calendar months. I spent many years using Google Sheets and a handful of scripts to template out budgets and reconcile transactions, but I decided it's time to just bite the bullet and write something that isn't a pain.

Intended Audience: This is decidedly not an end-user application. You should be familiar with Python/Flask/MySQL. If you're going to use the automatic transaction download functionality, you should be familiar with [Hashicorp Vault](#) and how to run a reasonably secure installation of it. I personally don't recommend running this on anything other than your own computer that you physically control, given the sensitivity of the information. I also don't recommend making the application available to anything other than localhost, but if you do, you need to be aware of the security implications. This application is **not** designed to be accessible in any way to anyone other than authorized users (i.e. if you just serve it over the web, someone *will* get your account numbers, or worse).

Note: Any potential users outside of the US should see the documentation section on [Currency Formatting and Localization](#); the short version is that I've done my best to make this configurable, but as far as I know I'm the only person using this software. If anyone else wants to use it and it doesn't work for your currency or locale, let me know and I'll fix it.

1.1 Important Warning

This software should be considered *alpha* quality at best. At this point, I can't even say that I'm 100% confident it is mathematically correct, balances are right, all scheduled transactions will show up in the right places, etc. I'm going to be testing it for my own purposes, and comparing it against my manual calculations. Until further notice, if you decide to use this, please double-check *everything* produced by it before relying on its output.

1.2 Main Features

- Budgeting on a biweekly (fortnightly; every other week) basis, for those of us who are paid that way.
- Periodic (per-pay-period) or standing budgets.
- Optional automatic downloading of transactions/statements from your financial institutions and reconciling transactions (bank, credit, and investment accounts).
- Scheduled transactions - specific date or recurring (date-of-month, or number of times per pay period).
- Tracking of vehicle fuel fills (fuel log) and graphing of fuel economy.
- Cost tracking for multiple projects, including bills-of-materials for them. Optional synchronization from Amazon Wishlists to projects.
- Calculation of estimated credit card payoff amount and time, with configurable payment methods, payment increases on specific dates, and additional payments on specific dates.

CHAPTER 2

Requirements

Note: Alternatively, biweeklybudget is also distributed as a [Docker container](#). Using the dockerized version will eliminate all of these dependencies aside from MySQL (which you can run in another container) and Vault (if you choose to take advantage of the OFX downloading), which you can also run in another container.

- Python 2.7 or 3.4+ (currently tested with 2.7, 3.4, 3.5, 3.6 and developed with 3.6)
- Python [VirtualEnv](#) and [pip](#) (recommended installation method; your OS/distribution should have packages for these)
- MySQL, or a compatible database (e.g. [MariaDB](#)). biweeklybudget uses [SQLAlchemy](#) for database abstraction, but currently specifies some MySQL-specific options, and is only tested with MySQL.
- To use the automated OFX transaction downloading functionality:
 - A running, reachable instance of [Hashicorp Vault](#) with your financial institution web credentials stored in it.
 - If your bank does not support OFX remote access (“Direct Connect”), you will need to write a custom screen-scraping class using Selenium and a browser.

CHAPTER 3

Installation

It's recommended that you install into a virtual environment (virtualenv / venv). See the [virtualenv usage documentation](#) for information on how to create a venv.

This app is developed against Python 3.6, but should work back to 2.7. It does not support Python3 < 3.4.

```
mkdir biweeklybudget
virtualenv --python=python3.6 .
source bin/activate
pip install biweeklybudget
```

CHAPTER 4

License

biweeklybudget itself is licensed under the [GNU Affero General Public License, version 3](#). This is specifically intended to extend to anyone who uses the software remotely over a network, the same rights as those who download and install it locally. biweeklybudget makes use of various third party software, especially in the UI and frontend, that is distributed under other licenses. Please see `biweeklybudget/flaskapp/static` in the source tree for further information.

biweeklybudget includes a number of dependencies distributed alongside it, which are licensed and distributed under their respective licenses. See the `biweeklybudget/vendored` directory in the source distribution for further information.

CHAPTER 5

Contents

5.1 Screenshots

5.1.1 Index Page

The screenshot shows the main dashboard of the BiweeklyBudget application. On the left, a sidebar menu lists various features: Home, Pay Periods, Accounts, Credit Payoffs, OFX, Transactions, Reconcile, Budgets, Scheduled, Fuel Log, Projects/Bold, and Help/Docs/Code (AGPL). The main content area is divided into several sections:

- Accounts:** Shows 2 accounts with stale data, with a link to view accounts.
- OFX Transactions:** Shows 32 unreconciled OFX transactions.
- Account Balances:** A line chart showing three accounts over time. The Y-axis ranges from \$7,500 to \$15,000. The accounts show fluctuating balances, with one account (red) generally increasing while others (blue and green) remain relatively stable around \$10,000.
- Bank Accounts:** A table showing bank account details. BankOne has a balance of \$13,763.15 (3+ hours ago), an un-reconciled amount of \$0.00, and a difference of \$13,763.15. BankTwoState has a balance of \$81.33 (1+ day ago), an un-reconciled amount of -\$333.33, and a difference of \$424.66.
- Credit Cards:** A table showing credit card details. CreditOne has a balance of -\$1,030.14 (3+ hours ago), available funds of \$969.86, and an available/unreconciled difference of \$747.86. CreditTwo has a balance of -\$5,017.03 (1+ day ago), available funds of \$482.97, and an available/unreconciled difference of \$482.97.
- Investment Accounts:** A table showing investment account details. InvestmentOne has a value of \$9,674.97 (3+ days ago).
- Standing Budgets:** A table showing standing budget details. It includes columns for Budget and Current Balance. Two entries are listed: Standing1 (4) with a budget of \$1,284.23 and Standing2 (5) with a budget of \$9,482.29.
- Pay Periods:** A table showing pay period details. It includes columns for Start Date, Allocated, Spent, and Remaining. The table lists dates from 2017-07-21 to 2017-01-10, with allocated amounts ranging from \$334.00 to \$345.11 and remaining amounts ranging from \$2,000.56 to \$2,013.87.

Main landing page.

5.1.2 Reconcile Transactions with OFX

OFX Transactions reported by financial institutions can be marked as reconciled with a corresponding Transaction.

Date	Description	Acct:	Type:	(make trans)
2017-07-28	Trans 3: T3	CreditOne (3)	Debit	(make trans)
2017-07-28	Trans 2: T2	BankTwoState (2)	Credit	(make trans)
2017-06-07		DisabledBank (8)	Debit	(make trans)
2017-06-15		DisabledBank (8)	Credit	(make trans)
2017-06-26	T2-1: \$60.00 Online Payment, thank you	CreditOne (3)	credit	(make trans)
2017-06-27	T2-2: INTEREST CHARGED TO STANDARD PUR	CreditOne (3)	debit	(make trans)
2017-07-05	Transfer to Other Account	BankTwoState (2)	Debit	(make trans)
2017-07-06	I: Interest Paid	BankTwoState (2)	Interest	(make trans)
2017-07-23	T2: \$50.00 Online Payment - Thank You	CreditTwo (4)	Credit	(make trans)
2017-07-26	T2: \$52.00 Online Payment, thank you	CreditOne (3)	credit	(make trans)
2017-07-26		CreditTwo (4)	Purchase	(make trans)
2017-07-27	T1: 123.81 Credit Purchase T3	CreditOne (3)	Purchase	(make trans)
2017-07-27		CreditOne (3)	debit	(make trans)

5.1.3 Drag-and-Drop Reconciling

To reconcile an OFX transaction with a Transaction, just drag and drop.

Date	Amount	Acct:	Budget:	Type:	Details
2017-07-26	\$222.22	CreditOne (3)	Periodic2 (2) (no OFX)		
2017-07-28	-\$333.33	BankTwoState (2)	Standing1 (4) (no OFX)		
2017-06-07	\$3,218.87	DisabledBank (8)		Debit	(make trans)
2017-06-15	\$0.01	DisabledBank (8)		Credit	(make trans)
2017-06-26	-\$60.00	CreditOne (3)		credit	(make trans)
2017-06-27	\$25.94	CreditOne (3)	INTEREST CHARGED TO STANDARD PUR	debit	(make trans)
2017-07-05	-\$432.19	BankTwoState (2)		Debit	(make trans)
	-05				
	-\$432.19				
2017-07-06	-90.23	BankTwoState (2)		Debit	(make trans)
	1: Interest Paid				
2017-07-23	-\$50.00	CreditTwo (4)		Credit	(make trans)
	002: Online Payment - Thank You				
2017-07-26	-\$52.00	CreditOne (3)		credit	(make trans)
	T2: \$52.00 Online Payment, thank you				
2017-07-26	\$28.53	CreditTwo (4)		Purchase	(make trans)
	003: Interest Charged				
2017-07-27	\$123.81	CreditOne (3)		Purchase	(make trans)
	T1: 123.81 Credit Purchase T3				
2017-07-27	\$28.25	CreditOne (3)		debit	(make trans)
	T3: INTEREST CHARGED TO STANDARD PUR

5.1.4 Pay Periods View

Summary of previous, current and upcoming pay periods, plus date selector to find a pay period.

Start Date	Allocated	Spent	Remaining
2017-07-07	\$2,401.51	\$2,401.51	-\$346.18
2017-07-21 [current]	\$2,491.83	\$2,491.83	-\$346.18
2017-08-04	\$2,040.03	\$1,817.83	\$305.64
2017-08-18	\$2,221.57	\$2,192.05	\$124.50
2017-09-01	\$2,388.00	\$2,185.78	-\$142.32
2017-09-15	\$2,132.36	\$1,890.36	\$213.31
2017-09-29	\$2,418.37	\$2,196.15	-\$72.70
2017-10-13	\$2,292.34	\$2,292.34	\$53.33
2017-10-27	\$2,434.32	\$2,212.10	-\$188.84
2017-11-10	\$1,669.54	\$1,669.54	\$676.62

5.1.5 Single Pay Period View

Shows a pay period (current in this example) balances (income, allocated, spent, remaining), budgets and transactions (previous/manually-entered and scheduled).

2017-07-21 to 2017-08-03 Pay Period - BiweeklyBudget

[Home](#) [Pay Periods](#) [Accounts](#) [Credit Payoffs](#) [OFX](#) [Transactions](#) [Reconcile](#) [Budgets](#) [Scheduled](#) [Fuel Log](#) [Projects / Bill](#) [Help/Docs/Code \(AGPL\)](#)

Combined balance of all budget/funding accounts (\$13,854.40) is less than all allocated funds total of \$15,193.18 (\$15,798.52 standing budgets, -\$0.02 current pay period remaining, \$4,428.68 unreconciled)

Remaining Balances		2017-07-21 (curr.)	2017-08-04 (next)	2017-08-18	2017-09-01
2017-07-07 (prev.)	\$13,854.40	-\$346.18	\$13,508.22	\$13,162.04	-\$42.32

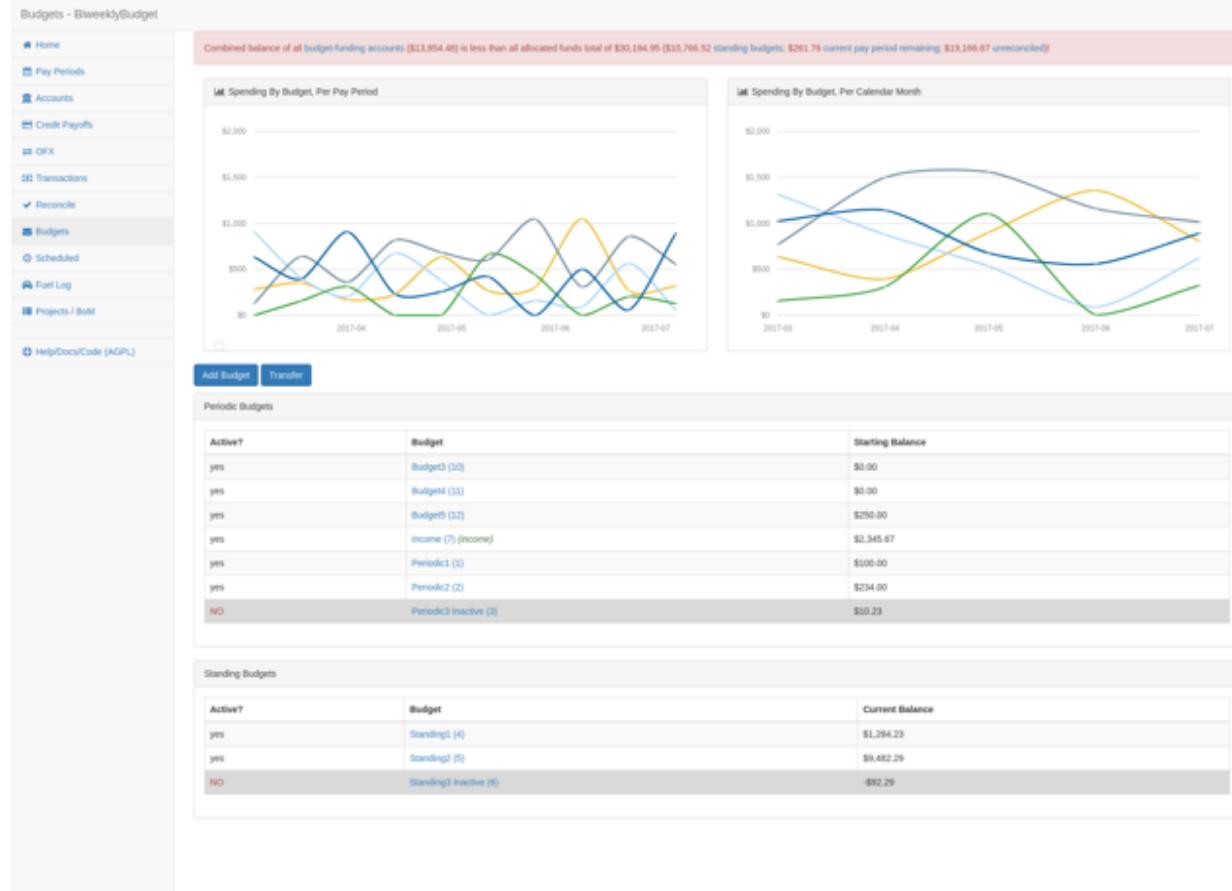

\$2,345.67		\$2,691.83		\$2,691.85		-\$346.18	
Income		Allocated		Spent		Remaining	
\$2,345.67		\$2,691.83		\$2,691.85		-\$346.18	

Periodic Budgets - Standby		Transactions - Standby									
Budget	Amount	Allocated	Spent	Remaining	Date	Amount	Description	Account	Budget	Scheduled?	Reconciled?
Periodic1	\$100.00	\$1,348.69	\$1,348.71	-\$1,248.71	2017-07-22	\$20.09	Transaction 1.1 (16)	BankOne	Budget1		
Periodic2	\$234.00	\$332.67	\$332.67	-\$99.67	2017-07-22	\$67.12	Transaction 1.4 (18)	BankOne	Budget4		
Income (I)	\$2,345.67	\$0.00	\$0.00	\$2,345.67	2017-07-22	\$139.49	Transaction 1.9 (24)	BankOne	Periodic2		
Budget3	\$0.00	\$289.71	\$289.71	-\$289.71	2017-07-22	\$230.89	Transaction 1.3 (18)	BankOne	Budget4		
Budget	\$0.00	\$720.77	\$720.77	-\$720.77	2017-07-22	\$289.71	Transaction 1.7 (22)	BankOne	Budget3

					2017-08-01	\$311.13	T1fee (1)	BankOne	Periodic1	(From I)	Yes (I)

Standing Budgets - Standby		Balance	
Budget	Balance		
Standing1	\$1,284.23		
Standing2	\$9,482.29		

5.1.6 Budgets

List all budgets, along with graphs of spending per budget, per payperiod and per month.

5.1.7 Single Budget View

The screenshot shows the biweeklybudget application interface. On the left, a sidebar menu includes Home, Pay Periods, Accounts, Credit Payoffs, OFX, Transactions, Reconcile, Budgets (selected), Scheduled, Fuel Log, Projects / Bolt, and Help/Docs/Code (AGPL). The main area displays a chart titled 'Combined balance of all budget funding accounts (\$13,950)' and a line graph titled 'Spending by Budget, Per Pay Period'. A modal window titled 'Edit Budget 2' is open, showing fields for Name (Periodic2), Type (Periodic), Description (P2desc), Starting Balance (\$ 234), Active? (checked), Income? (unchecked), and Omit from graphs? (unchecked). Buttons for Close and Save changes are at the bottom. Below the modal, sections for 'Periodic budgets' and 'Standing budgets' show tables of active budgets with their starting or current balances.

Active?	Budget	Starting Balance
yes	Budget3 (10)	\$0.00
yes	Budget1 (11)	\$0.00
yes	Budget2 (12)	\$250.00
yes	Income (7) (income)	\$2,345.67
yes	Periodic1 (3)	\$100.00
yes	Periodic2 (2)	\$234.00
NO	Periodic3 Inactive (8)	\$10.23

Active?	Budget	Current Balance
yes	Standing1 (4)	\$1,284.23
yes	Standing2 (5)	\$9,482.29
NO	Standing3 Inactive (6)	-\$82.29

Budget detail modal to view and edit a budget.

5.1.8 Transactions View

Transactions - BiweeklyBudget						
Add Transaction						
Date	Amount	Description	Account	Budget	Scheduled?	Budgeted Amount
2017-08-01	\$113.53	T1bu	BankOne (1)	Periodic1 (3)	Yes (1)	\$111.11
2017-07-26	-\$333.33	T2	BankTwoState (2)	Periodic2 (4)	Yes (3)	
2017-07-26	\$222.22	T3	CreditOne (3)	Periodic2 (2)		

Showing 1 to 3 of 3 entries

Shows all manually-entered transactions.

5.1.9 Transaction Detail

The screenshot shows the biweeklybudget application interface. On the left is a sidebar with navigation links: Home, Pay Periods, Accounts, Credit Payoffs, OFX, Transactions, Reconcile, Budgets, Scheduled, Fuel Log, Projects/Bold, Help/Docs/Code (AGPL). The main area displays a table of transactions with columns: Date, Amount, Description. The table shows three entries: 2017-07-01 (\$111.13 T1), 2017-07-26 (-\$333.33 T2), and 2017-07-26 (\$222.22 T3). A modal window titled "Edit Transaction 2" is open over the table. It contains fields for Date (2017-07-26), Amount (\$ -333.33), Description (T2), Account (Bank/Investments), Budget (Standing), and Notes (notesT2). At the bottom of the modal are "Close" and "Save changes" buttons.

Transaction detail modal to view and edit a transaction.

5.1.10 Accounts View

The screenshot shows the 'Accounts' view in the biweeklybudget application. The left sidebar contains a navigation menu with the following items:

- Home
- Pay Periods
- Accounts
- Credit Payoffs
- OFX
- Transactions
- Reconcile
- Budgets
- Scheduled
- Fuel Log
- Projects / Bold
- Help/Docs/Code (AGPL)

The main content area is divided into three sections:

- Bank Accounts**: Shows two bank accounts: BankOne and BankTwo. BankOne has a balance of \$13,763.15 (21 hours ago) and an unreconciled amount of \$0.00, resulting in a difference of \$13,763.15. BankTwo has a balance of \$91.33 (now) and an unreconciled amount of -\$333.33, resulting in a difference of \$424.66.
- Credit Cards**: Shows two credit cards: CreditOne and CreditTwo. CreditOne has a balance of -\$1,030.14 (21 hours ago), a credit limit of \$2,000.00, and an available amount of \$969.86, resulting in an unreconciled amount of \$22.22 and a difference of \$147.64. CreditTwo has a balance of -\$9,037.03 (21 hours ago), a credit limit of \$5,500.00, and an available amount of \$482.97, resulting in an unreconciled amount of \$0.00 and a difference of \$482.97.
- Investment Accounts**: Shows one investment account: InvestmentOne, with a value of \$9,674.97 (now).

5.1.11 Account Details

The screenshot shows the 'Accounts' section of the biweeklybudget application. On the left, a sidebar lists various menu items: Home, Pay Periods, Accounts, Credit Payoffs, OFX, Transactions, Reconcile, Budgets, Scheduled, Fuel Log, Projects / Bills, and Help/Docs/Code (AGPL). The 'Accounts' item is selected.

In the main area, there are three tabs: 'Bank Accounts', 'Credit Cards', and 'Investment Accounts'. The 'Bank Accounts' tab is active, showing two accounts: 'BankOne' and 'BankTwo/State'. A modal window titled 'Edit Account 1' is open for 'BankOne'. The modal contains fields for 'Name' (BankOne), 'Description' (First Bank Account), and 'Type' (radio buttons for Bank, Credit, Investment, with 'Bank' selected). It also includes sections for 'Vault/Creds Path' (secret/footer/BankOne) and 'OFX Getter Config (JSON)' ({"foo": "bar"}). There are checkboxes for 'Negate OFX Amounts', 'Reconcile Transactions?', and 'Active?' (which is checked). At the bottom of the modal are 'Close' and 'Save changes' buttons.

To the right of the modal, a table displays account details:

	Unreconciled	Difference
CreditOne	\$13,763.15	\$424.66
CreditTwo	\$222.22	\$147.64
InvestmentOne	\$0.00	\$482.97

Details of a single account.

5.1.12 OFX Transactions

OFX Transactions - BiweeklyBudget								
Show: 10 entries								
Date	Amount	Account	Type	Name	Memo	Description	RTID	L
2017-07-22	-420.00	BankOne (1)	Debit	Late Fee			BankOne.0.1	1
Date	Amount	Account	Type	Name	Memo	Description	RTID	L

Showing 1 to 1 of 1 entries

Shows transactions imported from OFX statements.

5.1.13 Scheduled Transactions

Scheduled Transactions - biweeklyBudget					
Add Scheduled Transaction					
Show 10 entries Type:					
Active?	Type	Recurrence	Amount	Description	
yes	per period	1 per period	\$8333.33	ST3	
yes	monthly	4th	\$222.22	ST2	
yes	date	2017-08-01	\$111.11	ST1	
NO	per period	3 per period	\$666.66	ST6	
NO	monthly	5th	\$555.55	ST5	
NO	date	2017-08-02	\$444.44	ST4	

List all scheduled transactions (active and inactive).

5.1.14 Specific Date Scheduled Transaction

The screenshot shows the 'Scheduled Transactions - BiweeklyBudget' application. On the left is a sidebar with links: Home, Pay Periods, Accounts, Credit Payoffs, OFX, Transactions, Reconcile, Budgets, Scheduled, Fuel Log, Projects / Bills, and Help/Docs/Code (AGPL). The main area displays a table of scheduled transactions with columns for Active?, Type, and description. A modal dialog titled 'Edit Scheduled Transaction 1' is open on the right, showing fields for Description (ST1), Type (Date), Specific Date (2017-08-01), Amount (\$ 111.11), Account (BankOne), Budget (Periodic1), Notes (notes/ST1), and Active? (checked). A 'Close' button is at the bottom right of the modal.

Scheduled transactions can occur one-time on a single specific date.

5.1.15 Monthly Scheduled Transaction

The screenshot shows the 'Scheduled Transactions' list on the left and a detailed edit modal on the right.

Scheduled Transactions - BiweeklyBudget

Edit Scheduled Transaction 2

Active?	Type
yes	per period
yes	monthly
yes	date
NO	per period
NO	monthly
NO	date

Description: ST2
Type: Monthly
Day of Month: 4
Amount: \$ 222.22
Account: BankOne
Budget: Periodic2
Notes: notesST2
Active?: Active?

Buttons: Close, Save changes

Scheduled transactions can occur monthly on a given date.

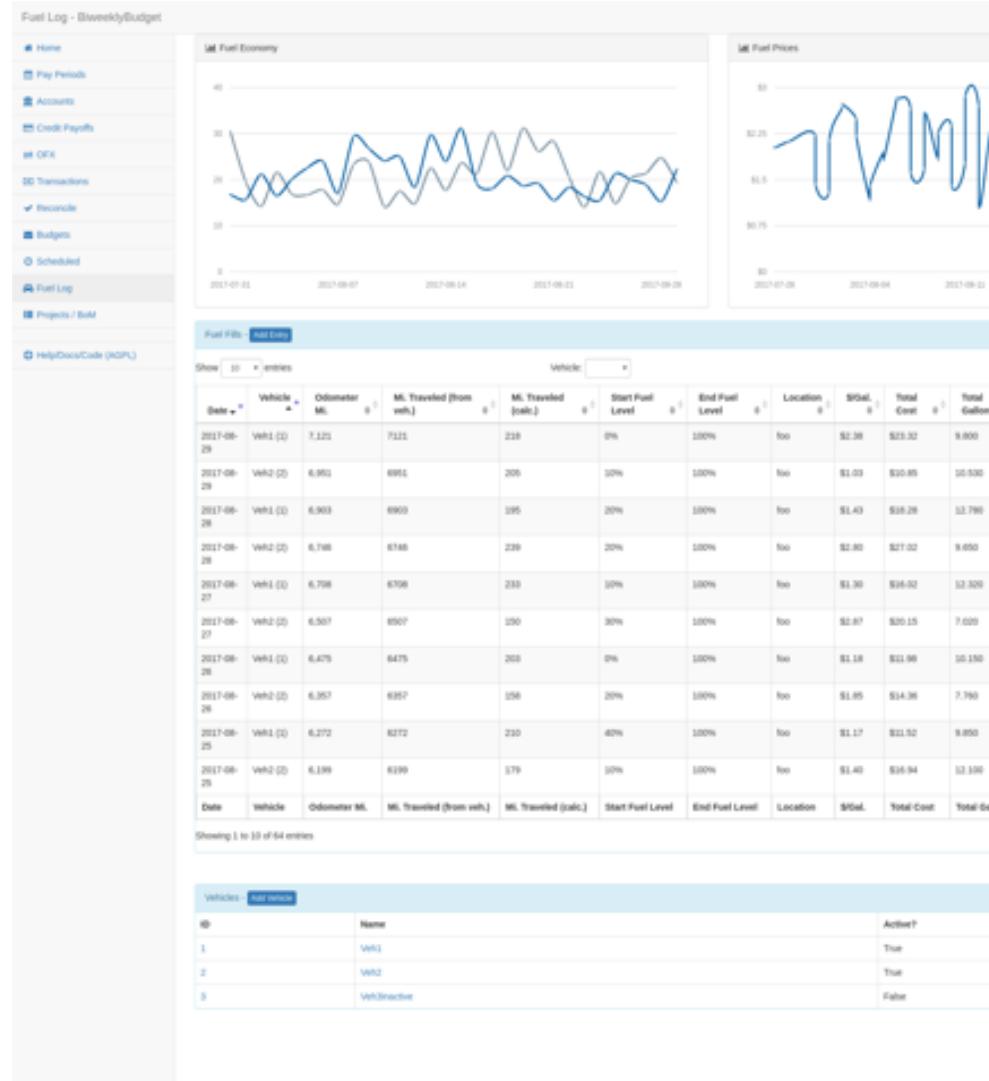

5.1.16 Number Per-Period Scheduled Transactions

Scheduled transactions can occur a given number of times per pay period.

The screenshot shows the biweeklybudget application interface. On the left is a sidebar with various menu items: Home, Pay Periods, Accounts, Credit Payoffs, OFX, Transactions, Reconcile (which is checked), Budgets, Scheduled, Fuel Log, Projects / Bill, and Help/Docs/Code (AGPL). The main area displays a table of scheduled transactions with columns for Account, Budget, and notes. A modal dialog titled "Edit Scheduled Transaction 3" is open in the center. It contains fields for Description (ST3), Type (set to "Per Period"), Number Per Pay Period (set to 1), Amount (-333.33), Account (BankTwoHole), Budget (StandingL), Notes (notes/ST3), and Active? (checkbox). Buttons at the bottom of the modal include "Close" and "Save changes".

Account	Budget
BankTwoHole (2)	Standing1 (4)
BankOne (1)	Periodic2 (2)
BankOne (1)	Periodic1 (1)
BankTwoHole (2)	Standing1 (4)
BankOne (1)	Periodic2 (2)
BankOne (1)	Periodic1 (1)

5.1.17 Fuel Log

Vehicle fuel log and fuel economy tracking.

5.1.18 Project Tracking

The screenshot shows the 'Projects / Bill of Materials' page. On the left is a sidebar with navigation links: Home, Pay Periods, Accounts, Credit Payoffs, OFX, Transactions, Reconcile, Budgets, Scheduled, Fuel Log, Projects / Bill of Materials (which is selected and highlighted in blue), and Help/Docs/Code (AGPL). The main area has two large summary boxes: one for 'Remaining Cost - Active Projects' showing \$77.77 and another for 'Total Cost - Active Projects' showing \$2,546.89. Below these is a table titled 'Projects / Bill of Materials' with columns for Project, Total Cost, Remaining Cost, Active?, and Notes. The table contains three entries: P1 (\$2,546.89, \$77.77, yes (deactivate), ProjectOne), P2 (\$0.00, \$0.00, yes (deactivate), ProjectTwo), and P3inactive (\$5.34, \$3.00, NO (activate), ProjectThreeinactive). At the bottom of the table is a note: 'Showing 1 to 3 of 3 entries'. There are input fields for 'Name' and 'Notes', and a 'Add Project' button.

Project	Total Cost	Remaining Cost	Active?	Notes
P1	\$2,546.89	\$77.77	yes (deactivate)	ProjectOne
P2	\$0.00	\$0.00	yes (deactivate)	ProjectTwo

Project	Total Cost	Remaining Cost	Active?	Notes

Track projects and their cost.

5.1.19 Projects - Bill of Materials

Name	Quantity	Unit Cost	Line Cost	Notes
PItem1	(edit)	\$11.11	\$11.11	PItem1Notes
PItem2	(edit)	\$22.22	\$66.66	PItem2Notes
PItem3	(edit)	\$1,234.56	\$2,469.12	PItem3Notes

Track individual items/materials for projects.

5.1.20 Credit Card Payoff Calculations

Credit card payoff calculations based on a variety of payment methods, with configurable payment increases over time or one-time additional payment amounts.

Credit Card Payoffs - BiweeklyBudget

- Home
- Pay Periods
- Accounts
- Credit Payoffs
- OFX
- Transactions
- Reminders
- Budgets
- Scheduled
- Tracing
- Projects / Tasks
- Help/Discord (APU)

Notice - Bi-weekly calculations are rough estimates only. Do not rely on them.

- These are based on the interest rate you entered in the Account settings. Interest rates will change over time.
- I've found these to be within 1% of my own statements for certain credit cards, but there is no guarantee that the exact formula used will match those used by your credit card company.
- These assume no fees or purchases against any of the accounts, i.e. the only balance changes will be one payment per billing period and interest for that period.
- This account calculation method may not exactly match your financial institution.
- Note that if you're trying to see how calculate multiple payoffs together, use the last balance for each account as if it were the beginning of a new billing cycle, and assume that all billing cycles are based on calendar months. All payments are made half way through that month.
- Some values are rounded.

Settings

Sum Of Minimum Monthly Payment(s)

Starting on: increase sum of monthly payments to: [\[remove\]](#)

[\[add another increment\]](#)

On the first payment date on or after: add to the payment amount. [\[remove\]](#)

[\[add another one-time additional payment\]](#)

[Basic & Miscellaneous](#)

MinPaymentMethod - Minimum Payment Only
Pay only the minimum on each statement.

Account	Next Payment	Time To Pay Off	Total Payments	Total Interest
CreditOne (2) (\$1,000.00 @ 1.00%)	\$25.00	3.5 years	\$1,040.97	\$12.94
CreditTwo (2) (\$1,000.00 @ 1.00%)	\$25.00	3.5 years	\$1,040.97	\$12.94
Totals	\$50.00	3.5 years	\$2,081.94	\$25.88

LowestBalanceFirstMethod - Lowest In Highest Interest Rate
Pay statements of from lowest to highest interest rate.

Account	Next Payment	Time To Pay Off	Total Payments	Total Interest
CreditOne (2) (\$1,000.00 @ 1.00%)	\$25.00	3.5 years	\$1,040.97	\$12.94
CreditTwo (2) (\$1,000.00 @ 1.00%)	\$25.00	4.7 years	\$1,097.40	\$65.37
Totals	\$50.00	4.7 years	\$2,138.37	\$68.31

LowestBalanceFirstMethod - Lowest In Highest Balance (i.e. "Snowball" Method)
Pay statements of from lowest to highest balance, a.k.a. the "snowball" method.

Account	Next Payment	Time To Pay Off	Total Payments	Total Interest
CreditOne (2) (\$1,000.00 @ 1.00%)	\$25.00	3.5 years	\$1,040.97	\$12.94
CreditTwo (2) (\$1,000.00 @ 1.00%)	\$25.00	4.7 years	\$1,097.40	\$65.37
Totals	\$50.00	4.7 years	\$2,138.37	\$68.31

HighestInterestFirstMethod - Highest In Lowest Interest Rate
Pay statements of from highest to lowest interest rate.

Account	Next Payment	Time To Pay Off	Total Payments	Total Interest
CreditOne (2) (\$1,000.00 @ 1.00%)	\$25.00	3.5 years	\$1,040.97	\$12.94
CreditTwo (2) (\$1,000.00 @ 1.00%)	\$25.00	4.0 years	\$1,055.12	\$55.29
Totals	\$50.00	4.0 years	\$2,096.19	\$58.23

HighestBalanceFirstMethod - Highest In Lowest Balance
Pay statements of from highest to lowest balance.

Account	Next Payment	Time To Pay Off	Total Payments	Total Interest
CreditOne (2) (\$1,000.00 @ 1.00%)	\$25.00	3.5 years	\$1,040.97	\$12.94
CreditTwo (2) (\$1,000.00 @ 1.00%)	\$25.00	4.0 years	\$1,055.12	\$55.29
Totals	\$50.00	4.0 years	\$2,096.19	\$58.23

5.2 Getting Started

5.2.1 Requirements

Note: Alternatively, biweeklybudget is also distributed as a [Docker container](#). Using the dockerized version will eliminate all of these dependencies aside from MySQL and Vault (the latter only if you choose to take advantage of the OFX downloading), both of which you can also run in containers.

- Python 2.7 or 3.4+ (currently tested with 2.7, 3.4, 3.5, 3.6 and developed with 3.6)
- Python [VirtualEnv](#) and [pip](#) (recommended installation method; your OS/distribution should have packages for these)

- MySQL, or a compatible database (e.g. MariaDB). biweeklybudget uses [SQLAlchemy](#) for database abstraction, but currently specifies some MySQL-specific options, and is only tested with MySQL.
- To use the automated OFX transaction downloading functionality:
 - A running, reachable instance of [Hashicorp Vault](#) with your financial institution web credentials stored in it.
 - If your bank does not support OFX remote access (“Direct Connect”), you will need to write a custom screen-scraper class using Selenium and a browser.

5.2.2 Installation

It's recommended that you install into a virtual environment (virtualenv / venv). See the [virtualenv usage documentation](#) for information on how to create a venv.

This app is developed against Python 3.6, but should work back to 2.7. It does not support Python3 < 3.4.

```
mkdir biweeklybudget
virtualenv --python=python3.6 .
source bin/activate
pip install biweeklybudget
```

Important Note: Anyone who's using this project for actual data should install from the package on PyPI. While the master branch of the git repository is always in a runnable state, there is no guarantee that data will be not be harmed by upgrading directly to master. Specifically, database migrations are only compatible between released versions; master is considered a pre-release/development version, and can have migrations removed or altered in breaking ways between official releases.

5.2.3 Upgrading

Documentation for upgrades depends on how you've installed and run biweeklybudget:

- For non-docker installations, see [Flask Application - Database Migrations](#)
- For Docker installations, no special action is needed.
- For development installations, see [Development - Alembic DB Migrations](#)

In all cases, you should always perform a full backup of your database before an upgrade.

5.2.4 Configuration

biweeklybudget can take its configuration settings via either constants defined in a Python module or environment variables. Configuration in environment variables always overrides configuration from the settings module.

Settings Module

`biweeklybudget.settings` imports all globals/constants from a module defined in the SETTINGS_MODULE environment variable. The recommended way to configure this is to create your own separate Python package for customization (either in a private git repository, or just in a directory on your computer) and install this package into the same virtualenv as biweeklybudget. You then set the SETTINGS_MODULE environment variable to the Python module/import path of this module (i.e. the dotted path, like `packagename.modulename`).

Once you've created the customization package, you can install it in the virtualenv with `pip install -e <git URL>` (if it is kept in a git repository) or `pip install -e <local path>`.

This customization package can also be used for [Loading Data](#) during development, or implementing [Custom OFX Downloading via Selenium](#). It is the recommended configuration method if you need to include more logic than simply defining static configuration settings.

Environment Variables

Every configuration setting can also be specified by setting an environment variable with the same name; these will override any settings defined in a SETTINGS_MODULE, if specified. Note that some environment variables require specific formatting of their values; see the [settings module documentation](#) for a list of these variables and the required formats.

5.2.5 Running Locally

Setup

```
source bin/activate
export SETTINGS_MODULE=<settings module>
```

It's recommended that you create an alias to do this for you. Alternatively, instead of setting SETTINGS_MODULE, you can export the required environment variables (see above).

Flask

For information on the Flask application and on running the Flask development server, see [Flask App](#).

5.2.6 Running In Docker

Biweeklybudget is also distributed as a [docker image](#), to make it easier to run without installing as many [Requirements](#).

You can pull the latest version of the image with `docker pull jantman/biweeklybudget:latest`, or a specific release version X.Y.Z with `docker pull jantman/biweeklybudget:X.Y.Z`. It is recommended that you run a specific version number, and that you make sure to perform a database backup before upgrading.

The only dependencies for a Docker installation are:

- MySQL, which can be run via Docker ([MariaDB official image](#) recommended) or local on the host
- Vault, if you wish to use the OFX downloading feature, which can also be run [via Docker](#)

Important Note: If you run MySQL and/or Vault in containers, please make sure that their data is backed up and will not be removed.

The [image](#) runs with the `tini` init wrapper and uses `gunicorn` under Python 3.6 to serve the web UI, exposed on port 80. Note that, while it runs with 4 worker threads, there is no HTTP proxy in front of Gunicorn and this image is intended for local network use by a single user/client. The image also automatically runs database migrations in a safe manner at start, before starting the Flask application.

For ease of running, the image defaults the SETTINGS_MODULE environment variable to `biweeklybudget.settings_example`. This allows leveraging the environment variable `configuration` overrides so that you need only specify configuration options that you want to override from `settings_example.py`.

For ease of running, it's highly recommended that you put your configuration in a Docker-readable environment variables file.

Environment Variable File

In the following examples, we reference the following environment variable file. It will override settings from `settings_example.py` as needed; specifically, we need to override the database connection string, pay period start date and reconcile begin date. In the examples below, we would save this as `biweeklybudget.env`:

```
DB_CONNSTRING=mysql+pymysql://USERNAME:PASSWORD@HOST:PORT/DBNAME?charset=utf8mb4
PAY_PERIOD_START_DATE=2017-03-28
RECONCILE_BEGIN_DATE=2017-02-15
```

Containerized MySQL Example

This assumes that you already have a MySQL database container running with the container name “mysql” and exposing port 3306, and that we want the biweeklybudget web UI served on host port 8080:

In our `biweeklybudget.env`, we would specify the database connection string for the “mysql” container:

```
DB_CONNSTRING=mysql+pymysql://USERNAME:PASSWORD@mysql:3306/DBNAME?charset=utf8mb4
```

And then run `biweeklybudget`:

```
docker run --name biweeklybudget --env-file biweeklybudget.env \
-p 8080:80 --link mysql:jantman/biweeklybudget:latest
```

Host-Local MySQL Example

It is also possible to use a MySQL server on the physical (Docker) host system. To do so, you’ll need to know the host system’s IP address. On Linux when using the default “bridge” Docker networking mode, this will correspond to a `docker0` interface on the host system. The Docker documentation on [adding entries to the Container’s hosts file](#) provides a helpful snippet for this (on my systems, this results in `172.17.0.1`):

```
ip -4 addr show scope global dev docker0 | grep inet | awk '{print $2}' | cut -d / -f
˓→1
```

In our `biweeklybudget.env`, we would specify the database connection string that uses the “`dockerhost`” hosts file entry, created by the `--add-host` option:

```
# "dockerhost" is added to /etc/hosts via the `--add-host` docker run option
DB_CONNSTRING=mysql+pymysql://USERNAME:PASSWORD@dockerhost:3306/DBNAME?charset=utf8mb4
```

So using that, we could run `biweeklybudget` listening on port 8080 and using our host’s MySQL server (on port 3306):

```
docker run --name biweeklybudget --env-file biweeklybudget.env \
--add-host="dockerhost:$(`ip -4 addr show scope global dev docker0 | grep inet | awk \
˓→'{print $2}' | cut -d / -f 1)`" \
-p 8080:80 jantman/biweeklybudget:latest
```

You may need to adjust those commands depending on your operating system, Docker networking mode, and MySQL server.

Settings Module Example

If you need to provide `biweeklybudget` with more complicated configuration, this is still possible via a Python settings module. The easiest way to inject one into the Docker image is to [mount](#) a python module directly into the

biweeklybudget package directory. Assuming you have a custom settings module on your local machine at /opt/biweeklybudget-settings.py, you would run the container as shown below to mount the custom settings module into the container and use it. Note that this example assumes using MySQL in another container; adjust as necessary if you are using MySQL running on the Docker host:

```
docker run --name biweeklybudget -e SETTINGS_MODULE=biweeklybudget.mysettings \
-v /opt/biweeklybudget-settings.py:/app/lib/python3.6/site-packages/biweeklybudget/
-mysettings.py \
-p 8080:80 --link mysql jantman/biweeklybudget:latest
```

Note on Locales

biweeklybudget uses Python's `locale` module to format currency. This requires an appropriate locale installed on the system. The docker image distributed for this package only includes the `en_US.UTF-8` locale. If you need a different one, please cut a pull request against `docker_build.py`.

Running ofxgetter in Docker

If you wish to use the `ofxgetter` script inside the Docker container, some special settings are needed:

1. You must mount the statement save path (`STATEMENTS_SAVE_PATH`) into the container.
2. You must mount the Vault token file path (`TOKEN_PATH`) into the container.
3. You must set either the `VAULT_ADDR` environment variable, or the `VAULT_ADDR` setting.

As an example, for using ofxgetter in Docker with your statements saved to `/home/myuser/statements` on your host computer and your Vault token stored in `/home/myuser/.vault-token` on your host computer, you would set `STATEMENTS_SAVE_PATH` in your settings file to `/statements` and `TOKEN_PATH` to `/.token`, and add to your `docker run` command:

```
-v /home/myuser/statements:/statements \
-v /home/myuser/.vault-token:/.token
```

Assuming your container was running with `--name biweeklybudget`, you could run ofxgetter (e.g. via cron) as:

```
docker exec biweeklybudget /bin/sh -c 'cd /statements && /app/bin/ofxgetter'
```

We run explicitly in the `statements` directory so that if `ofxgetter` encounters an error when using a `ScreenScraper` class, the screenshots and HTML output will be saved to the host filesystem.

5.2.7 Command Line Entrypoints and Scripts

biweeklybudget provides the following setuptools entrypoints (command-line script wrappers in `bin/`). First setup your environment according to the instructions above.

- `bin/db_tester.py` - Skeleton of a script that connects to and inits the DB. Edit this to use for one-off DB work. To get an interactive session, use `python -i bin/db_tester.py`.
- `loaddata` - Entrypoint for dropping **all** existing data and loading test fixture data, or your base data. This is an awful, manual hack right now.
- `ofxbackfiller` - Entrypoint to backfill OFX Statements to DB from disk.
- `ofxgetter` - Entrypoint to download OFX Statements for one or all accounts, save to disk, and load to DB. See [OFX](#).

- `wishlist2project` - For any projects with “Notes” fields matching an Amazon wishlist URL of a public wishlist (`^https://www.amazon.com/gp/registry/wishlist/`), synchronize the wishlist items to the project. Requires `wishlist==0.1.2`.

5.3 Application Usage

This documentation is a work in progress. I suppose if anyone other than me ever tries to use this, I'll document it a bit more.

5.3.1 Currency Formatting and Localization

biweeklybudget supports configurable currency symbols and display/formatting, controlled by the `LOCALE_NAME` and `CURRENCY_CODE` settings. The former must specify a [RFC 5646 / BCP 47](#) language tag with a region identifier (i.e. “en_US”, “en_GB”, “de_DE”, etc.). If it is not set in the settings module or via a `LOCALE_NAME` environment variable, it will be looked up from the `LC_ALL`, `LC_MONETARY`, or `LANG` environment variables, in that order. It cannot be a “C” or “C.” locale, as these do not specify currency formatting. The latter, `CURRENCY_CODE`, must be a valid [ISO 4217](#) Currency Code (i.e. “USD”, “EUR”, etc.) and can also be set via a `CURRENCY_CODE` environment variable.

In addition, the Fuel Log functionality supports customization of the volume, distance and fuel economy units via a set of settings (which can also be set via environment variables):

- `biweeklybudget.settings.FUEL_VOLUME_UNIT` and `biweeklybudget.settings.FUEL_VOLUME_ABBREVIATION`
- `biweeklybudget.settings.DISTANCE_UNIT` and `biweeklybudget.settings.DISTANCE_UNIT_ABBREVIATION`
- `biweeklybudget.settings.FUEL_ECO_ABBREVIATION`

These settings only effect the display of monetary units in the user interface and in log files. I haven't made any attempt at actual internationalization of the text, mainly because as far as I know I'm the only person in the world using this software. If anyone else uses it, I'll be happy to work to accomodate users of other languages or localities.

Right now, regarding localization and currency formatting, please keep in mind the following caveats (which I'd be happy to fix if anyone needs it):

- The currency specified in downloaded OFX files is ignored. Since currency conversion and exchange rates are far outside the scope of this application, it's assumed that all accounts will be in the currency defined in settings.
- The `wishlist2project` console script that parses Amazon Wishlists and updates Projects / BoMs with their contents currently only supports items priced in USD, and currently only supports wishlists on the US [amazon.com](#) site; these are limitations of the upstream project used for wishlist parsing.
- The database storage of monetary values assumes that they will all be a decimal number, and currently only allows for six digits to the left of the decimal and four digits to the right; this applies to all monetary units from transaction amounts to account balances. As such, if you have any transactions, budgets or accounts (including bank and investment accounts imported via OFX) with values outside of 999999.9999 to -999999.9999 (inclusive), the application will not function. If anyone needs support for larger numbers (or, at the rate I'm going, I'm still working and paying into my pension in about 300 years), the change shouldn't be terribly difficult.

5.4 Flask Application

5.4.1 Running Flask Development Server

Flask comes bundled with a builtin development server for fast local development and testing. This is an easy way to take biweeklybudget for a spin, but carries some important and critical warnings if you use it with real data. For upstream documentation, see the [Flask Development Server docs](#). Please note that the development server is a single process and defaults to single-threaded, and is only realistically usable by one user.

1. First, setup your environment per [Getting Started - Setup](#).
2. `export FLASK_APP="biweeklybudget.flaskapp.app"`
3. If you're running against an existing database, see important information in the "Database Migrations" section, below.
4. `flask --help` for information on usage:
 - Run App: `flask run`
 - Run with debug/reload: `flask rundev`

To run the app against the acceptance test database, use: `DB_CONNSTRING='mysql+pymysql://budgetTester@127.0.0.1:3306/budgettest?charset=utf8mb4' flask run`

By default, Flask will only bind to localhost. If you want to bind to all interfaces, you can add `--host=0.0.0.0` to the `flask run` commands. Please be aware of the implications of this (see "Security", below).

If you wish to run the flask app in a multi-process/thread/worker WSGI container, be sure that you run the `initdb` entrypoint before starting the workers. Otherwise, it's likely that all workers will attempt to create the database tables or run migrations at the same time, and fail.

5.4.2 Database Migrations

If you run the Flask application (whether in the flask development server or a separate WSGI container) against an existing database and there are unapplied Alembic database migrations, it's very likely that multiple threads or processes will attempt to perform the same migrations at the same time, and leave the database in an inconsistent and unusable state. As such, there are two important warnings:

1. Always be sure that you have a recent database backup before upgrading.
2. You must manually trigger database migrations before starting Flask. This can be done by running the `initdb` console script provided by the biweeklybudget package (`bin/initdb` in your virtualenv).

5.4.3 Security

This code hasn't been audited. It might have SQL injection vulnerabilities in it. It might dump your bank account details in HTML comments. Anything is possible!

To put it succinctly, this was written to be used by me, and me only. It was written with the assumption that anyone who can possibly access any of the application at all, whether in a browser or locally, is authorized to view and/or edit anything and everything related to the application (configuration, everything in the database, everything in Vault if it's being used). If you even think about making this accessible to anything other than localhost on a computer you physically own, it's entirely up to you how you secure it, but make sure you do it really well.

5.5 OFX Transaction Downloading

biweeklybudget has the ability to download OFX transaction data from your financial institutions, either manually or automatically (via an external command scheduler such as `cron`).

There are two overall methods of downloading transaction data; for banks that support the [OFX protocol](#), statement data can be downloaded using HTTP only, via the [ofxclient](#) project (note we vendor-in a fork with some bug fixes). For banks that do not support the OFX protocol and require you to use their website to download OFX format statements, biweeklybudget provides a base [ScreenScraper](#) class that can be used to develop a [selenium](#)-based tool to automate logging in to your bank's site and downloading the OFX file.

In order to use either of these methods, you must have an instance of [Hashicorp Vault](#) running and have your login credentials stored in it.

5.5.1 Important Note on Transaction Downloading

biweeklybudget includes support for automatically downloading transaction data from your bank. Credentials are stored in an instance of [Hashicorp Vault](#), as that is a project the author has familiarity with, and was chosen as the most secure way of storing and retrieving secrets non-interactively. Please keep in mind that it is your decision and your decision alone how secure your banking credentials are kept. What is considered acceptable to the author of this program may not be acceptably secure for others; it is your sole responsibility to understand the security and privacy implications of this program as well as Vault, and to understand the risks of storing your banking credentials in this way.

Also note that biweeklybudget includes a base class ([ScreenScraper](#)) intended to simplify developing [selenium](#)-based browser automation to log in to financial institution websites and download your transactions. Many banks and other financial institutions have terms of service that *explicitly forbid automated or programmatic use of their websites*. As such, it is up to you as the user of this software to determine your bank's policy and abide by it. I provide a base class to help in writing automated download tooling if your institution allows it, but I cannot and will not distribute institution-specific download tooling.

5.5.2 ofxgetter endpoint

This package provides an `ofxgetter` command line endpoint that can be used to download OFX statements for one or all Accounts that are appropriately configured. The script used for this provides exit codes and logging suitable for use via `cron` (it exits non-zero if any accounts failed, and unless options are provided to increase verbosity, only outputs the number of accounts successfully downloaded as well as any errors).

5.5.3 Vault Setup

Configuring and running Vault is outside the scope of this document. Once you have a Vault installation running and appropriately secured (you shouldn't be using the dev server unless you want to lose all your data every time you reboot) and have given biweeklybudget access to a valid token stored in a file somewhere, you'll need to ensure that your username and password data is stored in Vault in the proper format (username and password keys). If you happen to use [LastPass](#) to store your passwords, you may find my [lastpass2vault.py](#) helpful; run it as `./lastpass2vault.py -vv -f PATH_TO_VAULT_TOKEN LASTPASS_USERNAME` and it will copy all of your credentials from LastPass to Vault, preserving the folder structure.

5.5.4 Configuring Accounts for Downloading with ofxclient

1. Use the `ofxclient` CLI to configure and test your account, according to the [upstream documentation](#).

2. Store the username and password for your account in Vault, as `username` and `password` keys, respectively, of the same secret (path).
3. Convert `~/ofxclient.ini` to JSON (this will look something like the example below), removing the `institution.username` and `institution.password` keys (these will be read from Vault at run-time).
4. If there is no sensitive information in the resulting JSON, store the JSON string in the `ofxgetter_config_json` attribute of the appropriate `Account` object. This can be done via the `/accounts` view in the Web UI. If there *is* sensitive information in the ofxclient configuration JSON, you can store the entire JSON configuration in an additional key on the Vault secret, and then set the `ofxgetter_config_json` attribute to `{"key": "NameOfVaultKeyWithJSON"}`.

A working configuration for a Bank account might look something like this:

```
{
    "routing_number": "012345678",
    "account_type": "CHECKING",
    "description": "Checking",
    "number": "111222333",
    "local_id": "f0a14074d33cdf83b4a099bc322dbe2fe19680ca1719425b33de5022",
    "institution": {
        "client_args": {
            "app_version": "2200",
            "app_id": "QWIN",
            "ofx_version": "103",
            "id": "f87217350cc341e2ba7407cf99dcde"
        },
        "description": "MyBank",
        "url": "https://ofx.MyBank.com",
        "local_id": "e51fb78f88580a1c2e3bb65bd59495384388abda8796c9bf06dcf",
        "broker_id": "",
        "org": "ORG",
        "id": "98765"
    }
}
```

5.5.5 Configuring Accounts for Downloading with Selenium

In your *customization package* `<_getting_started.customization>`, subclass `ScreenScraper`. Override the constructor to take whatever keyword arguments are required, and add those to your account's `ofxgetter_config_json` as shown below. `OfxGetter` will instantiate the class passing it the specified keyword arguments in addition to `username`, `password` and `savedir` keyword arguments. `savedir` is the directory under `STATEMENTS_SAVE_PATH` where the account's OFX statements should be saved. After instantiating the class, `ofxgetter` will call the class's `run()` method with no arguments, and expect to receive an OFX statement string back.

If you need to persist cookies across sessions, look into the `ScreenScraper` class' `load_cookies()` and `save_cookies()` methods.

```
{
    "class_name": "MyScraper",
    "module_name": "budget_customization.myscraper",
    "institution": {},
    "kwargs": {
        "acct_num": "1234"
    }
}
```

```

    }
}
```

This JSON configuration will have the username and password from Vault interpolated as keyword arguments, similar to how they will be added to `institution` for ofxclient accounts. As described in ofxclient accounts #4, above, you can also store the entire JSON configuration in Vault if desired.

Here's a simple, contrived example of such a class:

```

import logging
import time
import codecs
from datetime import datetime

from selenium.common.exceptions import NoSuchElementException

from biweeklybudget.screenscraper import ScreenScraper

logger = logging.getLogger(__name__)

# suppress selenium logging
selenium_log = logging.getLogger("selenium")
selenium_log.setLevel(logging.WARNING)
selenium_log.propagate = True

class MyScraper(ScreenScraper):

    def __init__(self, username, password, savedir='./',
                 acct_num=None, screenshot=False):
        """
        :param username: username
        :type username: str
        :param password: password
        :type password: str
        :param savedir: directory to save OFX in

```

5.5.6 OFX Related Account Settings

The following attributes on the *Account* model effect OFX downloads and how OFX statements are handled:

- *ofxgetter_config_json* - Stores the configuration required for ofxclient- or Selenium-based OFX downloads. See above. This is exposed as the “OFXGetter Config (JSON)” form field when adding or editing accounts through the UI.
- *ofx_cat_memo_to_name* - This is exposed as the “OFX Cat Memo to Name” checkbox when adding or editing accounts through the UI.
- *negate_ofx_amounts* - This is exposed as the “Negate OFX Amounts” checkbox when adding or editing accounts through the UI.

5.6 Getting Help

5.6.1 Bugs and Feature Requests

Bug reports and feature requests are happily accepted via the [GitHub Issue Tracker](#). Pull requests are welcome. Issues that don’t have an accompanying pull request will be worked on as my time and priority allows.

5.7 Development

To install for development:

1. Fork the [biweeklybudget](#) repository on GitHub
2. Create a new branch off of master in your fork.

```
$ virtualenv biweeklybudget
$ cd biweeklybudget && source bin/activate
$ pip install -e git+git@github.com:YOURNAME/biweeklybudget.git@BRANCHNAME
  ↘#egg=biweeklybudget
$ cd src/biweeklybudget
```

The git clone you're now in will probably be checked out to a specific commit, so you may want to `git checkout BRANCHNAME`.

5.7.1 Guidelines

- pep8 compliant with some exceptions (see `pytest.ini`)
- 100% test coverage with `pytest` (with valid tests)

5.7.2 Loading Data

The sample data used for acceptance tests is defined in `biweeklybudget/tests/fixtures/sampledata.py`. This data can be loaded by *setting up the environment* `<_getting_started.setup>` and then using the `loaddata` entrypoint (the following values for options are actually the defaults, but are shown for clarity):

```
loaddata -m biweeklybudget.tests.fixtures.sampledata -c SampleDataLoader
```

This entrypoint will **drop all tables and data** and then load fresh data from the specified class.

If you wish, you can copy `biweeklybudget/tests/fixtures/sampledata.py` to your *customization package* `<_getting_started.customization>` and edit it to load your own custom data. This should only be required if you plan on dropping and reinitializing the database often.

5.7.3 Testing

Testing is done via `pytest`, driven by `tox`.

- testing is as simple as:
 - `pip install tox`
 - `tox`
- If you want to pass additional arguments to `pytest`, add them to the `tox` command line after “`-`”. i.e., for verbose `pytext` output on `py27` tests: `tox -e py27 -- -v`

For rapid iteration on tests, you can either use my `toxit` script to re-run the test commands in an existing `tox` environment, or you can use the `bin/t` and `bin/ta` scripts to run unit or acceptance tests, respectively, on only one module.

Unit Tests

There are minimal unit tests, really only some examples and room to test some potentially fragile code. Run them via the `^py\d+ tox` environments.

Integration Tests

There's a pytest marker for integration tests, effectively defined as anything that might use either a mocked/in-memory DB or the flask test client, but no HTTP server and no real RDBMS. Run them via the `integration tox` environment. But there aren't any of them yet.

Acceptance Tests

There are acceptance tests, which use a real MySQL DB (see the connection string in `tox.ini` and `conftest.py`) and a real Flask HTTP server, and selenium. Run them via the `acceptance tox` environment. Note that they're currently configured to use Headless Chrome; running them locally will require a modern Chrome version that supports the `--headless` flag (Chrome 59+) and a matching version of `chromedriver`.

The acceptance tests connect to a local MySQL database using a connection string specified by the `DB_CONNSTRING` environment variable, or defaulting to a DB name and user/password that can be seen in `conftest.py`. Once connected, the tests will drop all tables in the test DB, re-create all models/tables, and then load sample data. After the DB is initialized, tests will run the local Flask app on a random port, and run Selenium backed by headless Chrome.

If you want to run the acceptance tests without dumping and refreshing the test database, export the `NO_REFRESH_DB` environment variable. Setting the `NO_CLASS_REFRESH_DB` environment variable will prevent refreshing the DB after classes that manipulate data; this will cause subsequent tests to fail but can be useful for debugging.

Running Acceptance Tests Against Docker

The acceptance tests have a “hidden” hook to run against an already-running Flask application, run during the `docker` tox environment build. **Be warned** that the acceptance tests modify data, so they should never be run against a real database. This hook is controlled via the `BIWEEKLYBUDGET_TEST_BASE_URL` environment variable. If this variable is set, the acceptance tests will not start a Flask server, but will instead use the specified URL. The URL must not end with a trailing slash.

5.7.4 Alembic DB Migrations

This project uses [Alembic](#) for DB migrations:

- To generate migrations, run `alembic -c biweeklybudget/alembic/alembic.ini revision --autogenerate -m "message"` and examine/edit then commit the resulting file(s). This must be run *before* the model changes are applied to the DB. If adding new models, make sure to import the model class in `models/__init__.py`.
- To apply migrations, run `alembic -c biweeklybudget/alembic/alembic.ini upgrade head`.
- To see the current DB version, run `alembic -c biweeklybudget/alembic/alembic.ini current`.
- To see migration history, run `alembic -c biweeklybudget/alembic/alembic.ini history`.

5.7.5 Database Debugging

If you set the `SQL_ECHO` environment variable to “true”, all SQL run by SQLAlchemy will be logged at INFO level. To get an interactive Python shell with the database initialized, use `python -i bin/db_tester.py`.

5.7.6 Docker Image Build

Use the `docker` tox environment. See the docstring at the top of `biweeklybudget/tests/docker_build.py` for further information.

5.7.7 Frontend / UI

The UI is based on [BlackrockDigital’s startbootstrap-sb-admin-2](#), currently as of the 3.3.7-1 GitHub release. It is currently not modified at all, but should it need to be rebuilt, this can be done with: `pushd biweeklybudget/flaskapp/static/startbootstrap-sb-admin-2 && gulp`

Sphinx also generates documentation for the custom javascript files. This must be done manually on a machine with `jsdoc` installed, via: `tox -e jsdoc`.

5.7.8 Vendedored Requirements

A number of this project’s dependencies are or were seemingly abandoned, and weren’t responding to bugfix pull requests or weren’t pushing new releases to PyPI. This made the installation process painful, as it required `pip install -r requirements.txt` to pull in git requirements.

In an attempt to make installation easier, we’ve vendored any git requirements in to this repository under `biweeklybudget/vendored/`. The intent is to move these back to `setup.py` requirements when each project includes the fixes we need in its official release on PyPI.

To updated the vendored projects:

1. Update `biweeklybudget/vendored/install_vendored.sh`
2. Run `cd biweeklybudget/vendored && install_vendored.sh`
3. Ensure that our main `setup.py` includes all dependencies of the vendored projects.

5.7.9 Release Checklist

Run `dev/release.py`.

5.8 Changelog

5.8.1 0.7.1 (2018-01-10)

- Issue #170 - Upgrade **all** python dependencies to their latest versions.
- Issue #171 - Upgrade Docker base image from `python:3.6.3-alpine3.4` to `python:3.6.4-alpine3.7`.
- Issue #157 - Remove PhantomJS from Docker image, as it’s broken and shouldn’t be needed.
- Switch TravisCI builds from Docker (`sudo: false`) to VM (`sudo: enabled`) infrastructure.

5.8.2 0.7.0 (2018-01-07)

This version has a remote OFX upload incompatibility. See below.

- Issue #156 - Add headless chrome support to `screencraper.py`.
- Remove pluggy transient dependency from `requirements.txt`; was breaking builds.
- Following pytest, drop testing of and support for Python 3.3.
- Issue #159 - Implement internationalization of volume and distance units for Fuel Log pages. This change introduces five new settings: `FUEL_VOLUME_UNIT`, `FUEL_VOLUME_ABBREVIATION`, `DISTANCE_UNIT`, `DISTANCE_UNIT_ABBREVIATION` and `FUEL_ECO_ABBREVIATION`.
- Issue #154 - Fix documentation errors on the Getting Started page, “Running ofxgetter in Docker” section.
- Issue #152 - Fix for bug where new Transactions could be entered against inactive budgets. Ensure that existing transactions against inactive budgets can still be edited, but existing transactions cannot be changed to an inactive budget.
- Issue #161 - Fix bug where Transactions against inactive budgets weren’t counted towards payperiod overall or per-budget totals.
- Issue #163 - Include next payment amount on Credit Payoffs view.
- Issue #84 - Remove vendored-in `ofxpathre` package now that [my PR #127](#) has been merged and released on PyPI. **Important note:** The version of `ofxpathre` is changed in this release. If you are using `ofxgetter -r` (remote API mode), the versions of `ofxpathre` (and therefore `biweeklybudget/ofxgetter`) must match between the client and server.
- Issue #165 - Remove vendored-in `wishlist` package now that [my PR #8](#) has been merged and released on PyPI.
- Issue #155 - Refactor `ofxgetter` to fix bug where `SETTINGS_MODULE` was still required even if running remotely.

5.8.3 0.6.0 (2017-11-11)

- [PR #140](#) - Support user-configurable currencies and currency formatting. This isn’t all-out localization, but adds `CURRENCY_CODE` and `LOCALE_NAME` configuration settings to control the currency symbol and formatting used in the user interface and logs.
- [PR #141](#) - Switch acceptance tests from PhantomJS to headless Chrome.
- Switch docs build screenshot script to use headless Chrome instead of PhantomJS.
- Issue #142 - Speed up acceptance tests. The acceptance tests recently crossed the 20-minute barrier, which is unacceptable. This makes some improvements to the tests, mainly around combining classes that can be combined and also using mysql/mysqldump to refresh the DB, instead of refreshing and recreating via the ORM. That offers a approximately 50-90% speed improvement for each of the 43 refreshes. Unfortunately, it seems that the majority of time is taken up by pytest-selenium; see Issue 142 for further information.
- Issue #125 - Switch Docker image base from `python:3.6.1` (Debian) to `python:3.6.3-alpine3.4` (Alpine Linux); drops final image size from 876MB to 274MB. (*Note:* Alpine linux does not have `/bin/bash`.)
- Issue #138 - Improvements to build process
 - Run acceptance tests against the built Docker container during runs of the `docker tox` environment / `tests/docker_build.py`.
 - Reminder to sign git release tags

- Add `dev/release.py` script to handle GitHub releases.
- Issue #139 - Add field to Budget model to allow omitting specific budgets from spending graphs (the graphs on the Budgets view).

5.8.4 0.5.0 (2017-10-28)

This release includes database migrations.

- Issue #118 - PR to fix bugs in the `wishlist` dependency package, and vendor that patched version in under `biweeklybudget.vendored.wishlist`.
- Issue #113 - vendor in other git requirements (`ofxclient` and `ofxpathre`) that seem unmaintained or inactive, so we can install via `pip`.
- Issue #115 - In Transactions view, add ability to filter by budget.
- Change `BiweeklyPayPeriod` class to never convert to floats (always use `decimal.Decimal` types).
- Issue #124 - Major changes to the `ofxgetter` and `ofxbackfiller` console scripts; centralize all database access in them to the new `biweeklybudget.ofxapi.local.OfxApiLocal` class and allow these scripts to function remotely, interacting with the ReST API instead of requiring direct database access.
- Issue #123 - Modify the Credit Payoffs view to allow removal of Increase and Onetime Payment settings lines.
- Issue #131 - Add better example data for screenshots.
- Issue #117 and #133 - Implement and then revert out a failed attempt at automatic balancing of budgets in the previous pay period.
- Issue #114
 - Add `transfer_id` field and `transfer` relationship to Transaction model, to link the halves of budget transfer transactions in the database. The alembic migration for this release iterates all Transactions in the database, and populates these links based on inferences of the description, date, account_id and notes fields of sequential pairs of Transactions. (Note: this migration would likely miss some links if two transfers were created simultaneously, and ended up with the Transaction IDs interleaved).
 - Identify transfer Transactions on the Edit Transaction modal, and provide link to the matching Transaction.
 - Add graph of spending by budget to Budgets view.
- Issue #133 - Change `BiweeklyPayPeriod` model to only use actual spent amount when creating remaining amount on payperiods in the past. Previously, all pay periods calculated the overall “remaining” amount as income minus the greater of allocated or spent; this resulted in pay periods in the past still including allocated-but-not-spent amounts counted against “remaining”.

5.8.5 0.4.0 (2017-08-22)

- Have `ofxgetter` enable `ofxclient` logging when running at DEBUG level (`-vv`).
- Bump `ofxclient` requirement to my `vanguard-fix` branch for PR #47.
- Issue #101 - Fix static example amounts on /projects view.
- Issue #103 - Show most recent MPG in notification box after adding fuel fill.
- Issue #97 - Fix integration tests that are date-specific and break on certain dates (run all integration tests as if it were a fixed date).
- Issue #104 - Relatively major changes to add calculation of Credit account payoff times and amounts.

- Issue #107 - Fix bug where Budget Transfer modal dialog would always default to current date, even when viewing past or future pay periods.
- Issue #48 - UI support for adding and editing accounts.

5.8.6 0.3.0 (2017-07-09)

- Issue #88 - Add tracking of cost for Projects and Bills of Materials (BoM) for them.
- Add script / entry point to sync Amazon Wishlist with a Project.
- Issue #74 - Another attempt at working over-balance notification.

5.8.7 0.2.0 (2017-07-02)

- Fix /pay_period_for redirect to be a 302 instead of 301, add redirect logging, remove some old debug logging from that view.
- Fix logging exception in db_event_handlers on initial data load.
- Switch ofxpath requirement to use upstream repo now that <https://github.com/jseutter/ofxpath/pull/127> is merged.
- Issue #83 - Fix 500 error preventing display of balance chart on /view when an account has a None ledger balance.
- Issue #86 - Allow budget transfers to periodic budgets.
- Issue #74 - Warning notification for low balance should take current pay period's overall allocated sum, minus reconciled transactions, into account.
- Fix some template bugs that were causing HTML to be escaped into plaintext.
- Issue #15 - Add pay period totals table to index page.
- Refactor form generation in UI to use new FormBuilder javascript class (DRY).
- Fix date-sensitive acceptance test.
- Issue #87 - Add fuel log / fuel economy tracking.

5.8.8 0.1.2 (2017-05-28)

- Minor fix to instructions printed after release build in biweeklybudget/tests/docker_build.py
- Issue #61 - Document running ofxgetter in the Docker container.
- fix ReconcileRule repr for uncommitted (id is None)
- Issue #67 - ofxgetter logging - suppress DB and Alembic logging at INFO and above; log number of inserted and updated transactions.
- Issue #71 - Fix display text next to prev/curr/next periods on /payperiod/YYYY-mm-dd view; add 6 more future pay periods to the /payperiods table.
- Issue #72 - Add a built-in method for transferring money from periodic (per-pay-period) to standing budgets; add budget Transfer buttons on Budgets and Pay Period views.
- Issue #75 - Add link on payperiod views to skip a ScheduledTransaction instance this period.
- Issue #57 - Ignore future transactions from unreconciled transactions list.

- Transaction model - fix default for `date` field to actually be just a date; previously, Transactions with `date` left as default would attempt to put a full datetime into a date column, and throw a data truncation warning.
- Transaction model - Fix `__repr__` to not throw exception on un-persisted objects.
- When adding or updating the `actual_amount` of a Transaction against a Standing Budget, update the `current_balance` of the budget.
- Fix ordering of Transactions table on Pay Period view, to properly sort by date and then amount.
- Numerous fixes to date-sensitive acceptance tests.
- [Issue #79](#) - Update `/pay_period_for` view to redirect to current pay period when called with no query parameters; add bookmarkable link to current pay period to Pay Periods view.

5.8.9 0.1.1 (2017-05-20)

- Improve ofxgetter/ofxupdater error handling; catch OFX files with error messages in them.
- [Issue #62](#) - Fix phantomjs in Docker image.
 - * Allow docker image tests to run against an existing image, defined by `DOCKER_TEST_TAG`.
 - * Retry MySQL DB creation during Docker tests until it succeeds, or fails 10 times.
 - * Add testing of PhantomJS in Docker image testing; check version and that it actually works (GET a page).
 - * More reliable stopping and removing of Docker containers during Docker image tests.
- [Issue #63](#) - Enable gunicorn request logging in Docker container.
- Switch to my fork of ofxclient in requirements.txt, to pull in ofxclient PR #41
- [Issue #64](#) - Fix duplicate/multiple on click event handlers in UI that were causing duplicate transactions.

Returns list of all template paths

Return type list

biweeklybudget.flaskapp.context_processors module

biweeklybudget.flaskapp.filters module

biweeklybudget.flaskapp.jinja_tests module

biweeklybudget.flaskapp.jsonencoder module

```
class biweeklybudget.flaskapp.jsonencoder.MagicJSONEncoder(skipkeys=False, ensure_ascii=True, check_circular=True, allow_nan=True, sort_keys=False, indent=None, separators=None, encoding='utf-8', default=None)
```

Bases: json.encoder.JSONEncoder

Customized JSONEncoder class that uses `as_dict` properties on objects to encode them.

default (*o*)

biweeklybudget.flaskapp.notifications module

```
class biweeklybudget.flaskapp.notifications.NotificationsController
```

Bases: object

static budget_account_sum (*sess=None*)

Return the sum of current balances for all `is_budget_source` accounts.

Returns Combined balance of all budget source accounts

Return type float

static budget_account_unreconciled (*sess=None*)

Return the sum of unreconciled txns for all `is_budget_source` accounts.

Returns Combined unreconciled amount of all budget source accounts

Return type float

static get_notifications ()

Return all notifications that should be displayed at the top of pages, as a list in the order they should appear. Each list item is a dict with keys “classes” and “content”, where classes is the string that should appear in the notification div’s “class” attribute, and content is the string content of the div.

static num_stale_accounts (*sess=None*)

Return the number of accounts with stale data.

@TODO This is a hack because I just cannot figure out how to do this natively in SQLAlchemy.

Returns count of accounts with stale data

Return type int

static num_unreconciled_ofx(sess=None)

Return the number of unreconciled OFXTransactions.

Returns number of unreconciled OFXTransactions

Return type int

static pp_sum(sess=None)

Return the overall allocated sum for the current payperiod minus the sum of all reconciled Transactions for the pay period.

Returns overall allocated sum for the current pay period minus the sum of all reconciled Transactions for the pay period.

Return type float

static standing_budgets_sum(sess=None)

Return the sum of current balances of all standing budgets.

Returns sum of current balances of all standing budgets

Return type float

biweeklybudget.models package

Submodules

biweeklybudget.models.account module

class biweeklybudget.models.account.Account (**kwargs)

Bases: sqlalchemy.ext.declarative.api.Base, biweeklybudget.models.base.
ModelAsDict

_sa_class_manager = {'acct_type': <sqlalchemy.orm.attributes.InstrumentedAttribute ob

acct_type

Type of account (Enum AcctType)

all_statements

Relationship to all OFXStatement for this Account

apr

Finance rate (APR) for credit accounts

balance

Return the latest AccountBalance object for this Account.

Returns latest AccountBalance for this Account

Return type biweeklybudget.models.account_balance.AccountBalance

credit_limit

credit limit, for credit accounts

description

description

effective_apr

Return the effective APR for a credit account. If `prime_rate_margin` is not Null, return that added to the current US Prime Rate. Otherwise, return `apr`.

Returns Effective account APR

Return type `decimal.Decimal`

for_ofxgetter

Return whether or not this account should be handled by ofxgetter.

Returns whether or not ofxgetter should run for this account

Return type `bool`

id

Primary Key

interest_class_name

Name of the `biweeklybudget.interest._InterestCalculation` subclass used to calculate interest for this account.

is_active

whether or not the account is active and can be used, or historical

is_budget_source

Return whether or not this account should be considered a funding source for Budgets.

Returns whether or not this account is a Budget funding source

Return type `bool`

is_stale

Return whether or not there is stale data for this account.

Returns whether or not data for this account is stale

Return type `bool`

min_payment_class_name

Name of the `biweeklybudget.interest._MinPaymentFormula` subclass used to calculate minimum payments for this account.

name

name for the account

negate_ofx_amounts

For use in reconciling our `Transaction` entries with the account's `OFXTransaction` entries, whether or not to negate the OfxTransaction amount. We enter Transactions with income as negative amounts and expenses as positive amounts, but most bank OFX statements will show the opposite.

ofx_cat_memo_to_name

whether or not to concatenate the OFX memo text onto the OFX name text; for banks like Chase that use the memo for run-on from the name

ofx_statement

Return the latest OFXStatement for this Account.

Returns latest OFXStatement for this Account

Return type `biweeklybudget.models.ofx_statement.OFXStatement`

ofxgetter_config

Return the deserialized ofxgetter_config_json dict.

Returns ofxgetter config

Return type dict

ofxgetter_config_json
JSON-encoded ofxgetter configuration

prime_rate_margin
Margin added to the US Prime Rate to determine APR, for credit accounts.

re_fee
regex for matching transactions as fees

re_interest_charge
regex for matching transactions as interest charges

re_interest_paid
regex for matching transactions as interest paid

re_payment
regex for matching transactions as payments

reconcile_trans
Include Transactions and OFXTransactions from this account when reconciling. Set to False to exclude accounts that are investment, payment only, or otherwise won't have a matching Transaction for each OFXTransaction.

set_balance (kwargs)**
Create an AccountBalance object for this account and associate it with the account. Add it to the current session.

set_ofxgetter_config(config)
Set ofxgetter configuration.

Parameters config (dict) – ofxgetter configuration

unreconciled
Return a query to match all unreconciled Transactions for this account.

Parameters db (sqlalchemy.orm.session.Session) – active database session to use for queries

Returns query to match all unreconciled Transactions

Return type sqlalchemy.orm.query.Query

unreconciled_sum
Return the sum of all unreconciled transaction amounts for this account.

Returns sum of amounts of all unreconciled transactions

Return type float

vaultcreds_path
path in Vault to read the credentials from

class biweeklybudget.models.account.AcctType

```

biweeklybudget.models.budget_model module

```
class biweeklybudget.models.budget_model.Budget(**kwargs)
    Bases: sqlalchemy.ext.declarative.api.Base, biweeklybudget.models.base.
    ModelAsDict
    _sa_class_manager = {'current_balance': <sqlalchemy.orm.attributes.InstrumentedAttribute object at 0x7f3e3a0000>}
    current_balance
        current balance for standing budgets
    description
        description
    id
        Primary Key
    is_active
        whether active or historical
    is_income
        whether this is an Income budget (True) or expense (False).
    is_periodic
        Whether the budget is standing (long-running) or periodic (resets each pay period or budget cycle)
    name
        name of the budget
    omit_from_graphs
        whether or not to omit this budget from spending graphs
    starting_balance
        starting balance for periodic budgets
```

biweeklybudget.models.dbsetting module

```
class biweeklybudget.models.dbsetting.DBSetting(**kwargs)
    Bases: sqlalchemy.ext.declarative.api.Base, biweeklybudget.models.base.
    ModelAsDict
    _sa_class_manager = {'default_value': <sqlalchemy.orm.attributes.InstrumentedAttribute object at 0x7f3e3a0000>}
    default_value
        Default value - usually JSON
    is_json
        Whether setting is JSON, or plain text
    name
        Primary Key
    value
        Setting value - usually JSON
```

biweeklybudget.models.fuel module

```
class biweeklybudget.models.fuel.FuelFill(**kwargs)
    Bases: sqlalchemy.ext.declarative.api.Base, biweeklybudget.models.base.
```

ModelAsDict

_previous_entry()

Get the previous fill for this vehicle by odometer reading, or None.

Returns the previous fill for this vehicle, by odometer reading, or None.

Return type `biweeklybudget.models.fuel.FuelFill`

_sa_class_manager = {'calculated_miles': <sqlalchemy.orm.attributes.InstrumentedAttribute object at 0x0000000000000000>}

calculate_mpg()

Calculate calculated_mpg field.

Returns True if recalculate, False if unable to calculate

Return type `bool`

calculated_miles

Number of miles actually traveled since the last fill.

calculated_mpg

Calculated MPG, based on last fill

cost_per_gallon

Fuel cost per gallon

date

date of the fill

fill_location

Location of fill - usually a gas station name/address

gallons

Total amount of fuel (gallons)

id

Primary Key

level_after

Fuel level after fill, as a percentage (Integer 0-100)

level_before

Fuel level before fill, as a percentage (Integer 0-100)

notes

Notes

odometer_miles

Odometer reading of the vehicle, in miles

reported_miles

Number of miles the vehicle thinks it's traveled since the last fill.

reported_mpg

MPG as reported by the vehicle itself

total_cost

Total cost of fill

validate_gallons (`_, value`)

validate_odometer_miles (`_, value`)

vehicle

The vehicle

```

vehicle_id
    ID of the vehicle

class biweeklybudget.models.fuel.Vehicle(**kwargs)
Bases: sqlalchemy.ext.declarative.api.Base, biweeklybudget.models.base.
ModelAsDict

_sa_class_manager = {'id': <sqlalchemy.orm.attributes.InstrumentedAttribute object at
id
    Primary Key

is_active
    whether active or historical

name
    Name of vehicle

```

biweeklybudget.models.ofx_statement module

```

class biweeklybudget.models.ofx_statement.OFXStatement(**kwargs)
Bases: sqlalchemy.ext.declarative.api.Base, biweeklybudget.models.base.
ModelAsDict

_sa_class_manager = {'account': <sqlalchemy.orm.attributes.InstrumentedAttribute object at
account
    Relationship to the Account this statement is for

account_id
    Foreign key - Account.id - ID of the account this statement is for

acct_type
    Textual account type, from the bank (i.e. "Checking")

acctid
    Institution's account ID

as_of
    Last OFX statement datetime

avail_bal
    Available balance

avail_bal_as_of
    as-of date for the available balance

bankid
    FID of the Institution

brokerid
    BrokerID, for investment accounts

currency
    Currency definition ("USD")

file_mtime
    File mtime

filename
    Filename parsed from

```

id
Unique ID

ledger_bal
Ledger balance, or investment account value

ledger_bal_as_of
as-of date for the ledger balance

routing_number
Routing Number

type
Account Type, string corresponding to ofxparser.ofxparser.AccountType

biweeklybudget.models.ofx_transaction module

```
class biweeklybudget.models.ofx_transaction.OFXTransaction(**kwargs)
Bases: sqlalchemy.ext.declarative.api.Base, biweeklybudget.models.base.
ModelAsDict

_sa_class_manager = {'account': <sqlalchemy.orm.attributes.InstrumentedAttribute object>
account
    Account this transaction is associated with

account_amount
    Return the amount of the transaction, appropriately negated if the Account for this transaction has
    negate_ofx_amounts True.

        Returns amount, negated as appropriate
        Return type decimal.Decimal

account_id
    Account ID this transaction is associated with

amount
    OFX - Amount

checknum
    OFX - Checknum

date_posted
    OFX - Date Posted

description
    Description

first_statement_by_date
    Return the first OFXStatement on or after self.date_posted.

        Returns first OFXStatement on or after self.date_posted
        Return type biweeklybudget.models.ofx_statement.OFXStatement

fitid
    OFX - FITID

is_interest_charge
    Account's re_interest_charge matched
```

```
is_interest_payment
    Account's re_interest_paid matched

is_late_fee
    Account's re_late_fee matched

is_other_fee
    Account's re_fee matched

is_payment
    Account's re_payment matched

mcc
    OFX - MCC

memo
    OFX - Memo

name
    OFX - Name

notes
    Notes

static params_from_ofxpather_transaction(t, acct_id, stmt, cat_memo=False)
    Given an ofxpather.ofxpather.Transaction object, generate and return a dict of kwargs to create a new
    OFXTransaction.
```

Parameters

- **t** (`ofxpather.ofxpather.Transaction`) – ofxpather transaction
- **acct_id** (`int`) – OFXAccount ID
- **stmt** (`biweeklybudget.models.ofx_statement.OFXStatement`) – OFXS-
 statement this transaction was on
- **cat_memo** (`bool`) – whether or not to concatenate OFX Memo to Name

Returns dict of kwargs to create an OFXTransaction

Return type `dict`

```
reconcile_id
    The reconcile_id for the OFX Transaction
```

```
sic
    OFX - SIC
```

```
statement
    OFXStatement this transaction was last seen in
```

```
statement_id
    OFXStatement ID this transaction was last seen in
```

```
trans_type
    OFX - Transaction Type
```

```
static unreconciled(db)
    Return a query to match all unreconciled OFXTransactions.
```

Parameters `db` (`sqlalchemy.orm.session.Session`) – active database session to use
 for queries

Returns query to match all unreconciled OFXTransactions

Return type sqlalchemy.orm.query.Query

biweeklybudget.models.projects module

```
class biweeklybudget.models.projects.BoMItem(**kwargs)
    Bases:      sqlalchemy.ext.declarative.api.Base,    biweeklybudget.models.base.
    ModelAsDict
    _sa_class_manager = {'id': <sqlalchemy.orm.attributes.InstrumentedAttribute object at
    id
        Primary Key
    is_active
        whether active or historical
    line_cost
        The total cost for this BoM Item, unit_cost times quantity
        Returns total line cost
        Return type decimal.Decimal
    name
        Name of item
    notes
        Notes / Description
    project
        Relationship to the Project this item is for
    project_id
        Project ID
    quantity
        Quantity Required
    unit_cost
        Unit Cost / Cost Each
    url
        URL
class biweeklybudget.models.projects.Project(**kwargs)
    Bases:      sqlalchemy.ext.declarative.api.Base,    biweeklybudget.models.base.
    ModelAsDict
    _sa_class_manager = {'id': <sqlalchemy.orm.attributes.InstrumentedAttribute object at
    id
        Primary Key
    is_active
        whether active or historical
    name
        Name of project
    notes
        Notes / Description
```

remaining_cost

Return the remaining cost of all line items ([BoMItem](#)) for this project which are still active

Returns remianing cost of this project

Return type float

total_cost

Return the total cost of all line items ([BoMItem](#)) for this project.

Returns total cost of this project

Return type float

biweeklybudget.models.reconcile_rule module

```
class biweeklybudget.models.reconcile_rule.ReconcileRule(**kwargs)
    Bases:      sqlalchemy.ext.declarative.api.Base,    biweeklybudget.models.base.
              ModelAsDict
    _sa_class_manager = {'id': <sqlalchemy.orm.attributes.InstrumentedAttribute object at
    id
        Primary Key
    is_active
        whether the rule is enabled or disabled
    name
        Name of the rule
```

biweeklybudget.models.scheduled_transaction module

```
class biweeklybudget.models.scheduled_transaction.ScheduledTransaction(**kwargs)
    Bases:      sqlalchemy.ext.declarative.api.Base,    biweeklybudget.models.base.
              ModelAsDict
    _sa_class_manager = {'account': <sqlalchemy.orm.attributes.InstrumentedAttribute objec
    account
        Relationship - Account the transaction is against
    account_id
        ID of the account the transaction is against
    amount
        Amount of the transaction
    budget
        Relationship - Budget the transaction is against
    budget_id
        ID of the budget the transaction is against
    date
        Denotes a scheduled transaction that will happen once on the given date
    day_of_month
        Denotes a scheduled transaction that happens on the same day of each month
```

description
description

id
Primary Key

is_active
whether the scheduled transaction is enabled or disabled

notes
notes

num_per_period
Denotes a scheduled transaction that happens N times per pay period

recurrence_str
Return a string describing the recurrence interval. This is a string of the format YYYY-mm-dd, N per period or N(st|nd|rd|th) where N is an integer.

Returns string describing recurrence interval

Return type str

schedule_type
Return a string describing the type of schedule; one of date (a specific Date), per period (a number per pay period)“ or monthly (a given day of the month).

Returns string describing type of schedule

Return type str

validate_day_of_month(_, value)

validate_num_per_period(_, value)

biweeklybudget.models.transaction module

```
class biweeklybudget.models.transaction.Transaction(**kwargs)
    Bases: sqlalchemy.ext.declarative.api.Base, biweeklybudget.models.base.
    ModelAsDict

    _sa_class_manager = {'account': <sqlalchemy.orm.attributes.InstrumentedAttribute object>}

    account
        Relationship - Account this transaction is against

    account_id
        ID of the account this transaction is against

    actual_amount
        Actual amount of the transaction

    budget
        Relationship - the Budget this transaction is against

    budget_id
        ID of the Budget this transaction is against

    budgeted_amount
        Budgeted amount of the transaction

    date
        date of the transaction
```

description
description

id
Primary Key

notes
free-form notes

scheduled_trans
Relationship - the *ScheduledTransaction* this Transaction was created from; set when a scheduled transaction is converted to a real one

scheduled_trans_id
ID of the ScheduledTransaction this Transaction was created from; set when a scheduled transaction is converted to a real one

transfer
Relationship - the *Transaction* that makes up the other half/side of a transfer, if this transaction was for a transfer.

transfer_id
If the transaction is one half of a transfer, the Transaction ID of the other half/side of the transfer.

static unreconciled(db)
Return a query to match all unreconciled Transactions.

Parameters `db (sqlalchemy.orm.session.Session)` – active database session to use for queries

Returns query to match all unreconciled Transactions

Return type `sqlalchemy.orm.Query`

biweeklybudget.models.txn_reconcile module

```
class biweeklybudget.models.txn_reconcile.TxnReconcile(**kwargs)
    Bases: sqlalchemy.ext.declarative.api.Base, biweeklybudget.models.base.
    ModelAsDict
    _sa_class_manager = {'id': <sqlalchemy.orm.attributes.InstrumentedAttribute object at
    id
        Primary Key
    note
        Notes
    ofx_account_id
        OFX Transaction Account ID
    ofx_fitid
        OFX Transaction FITID
    ofx_trans
        Relationship - OFXTransaction
    reconciled_at
        time when this reconcile was made
    rule
        Relationship - ReconcileRule that created this reconcile, if any.
```

rule_id

ReconcileRule ID; set if this reconcile was created by a rule

transaction

Relationship - *Transaction*

txn_id

Transaction ID

biweeklybudget.models.utils module

`biweeklybudget.models.utils.do_budget_transfer(db_sess, txn_date, amount, account,
from_budget, to_budget, notes=None)`

Transfer a given amount from `from_budget` to `to_budget` on `txn_date`. This method does NOT commit database changes. There are places where we rely on this function not committing changes.

Parameters

- `db_sess` (`sqlalchemy.orm.session.Session`) – active database session to use for queries
- `txn_date` (`datetime.date`) – date to make the transfer Transactions on
- `amount` (`float`) – amount of money to transfer
- `account` (`biweeklybudget.models.account.Account`) –
- `from_budget` (`biweeklybudget.models.budget_model.Budget`) –
- `to_budget` (`biweeklybudget.models.budget_model.Budget`) –
- `notes` (`str`) – Notes to add to the Transaction

Returns list of Transactions created for the transfer

Return type list of *Transaction* objects

biweeklybudget.ofxapi package

`biweeklybudget.ofxapi.apiclient(api_url=None, ca_bundle=None, client_cert=None,
client_key=None)`

Submodules**biweeklybudget.ofxapi.exceptions module**

exception `biweeklybudget.ofxapi.exceptions.DuplicateFileException(acct_id,
filename,
stmt_id)`

Bases: `exceptions.Exception`

Exception raised when trying to parse a file that has already been parsed for the Account (going by the OFX signon date).

biweeklybudget.ofxapi.local module

```
class biweeklybudget.ofxapi.local.OfxApiLocal(db_sess)
    Bases: object
```

_create_statement(acct, ofx, mtime, filename)

Create an OFXStatement for this OFX file. If one already exists with the same account and filename, raise DuplicateFileException.

Parameters

- **acct** (`biweeklybudget.models.account.Account`) – the Account this statement is for
- **ofx** (`ofxpathre.ofxpathre.Ofx`) – Ofx instance for parsed file
- **mtime** (`datetime.datetime`) – OFX file modification time (or current time)
- **filename** (`str`) – OFX file name

Returns the OFXStatement object

Return type `biweeklybudget.models.ofx_statement.OFXStatement`

Raises DuplicateFileException

_new_updated_counts()

Return integer counts of the number of `OFXTransaction` objects that have been created and updated.

Returns 2-tuple of new OFXTransactions created, OFXTransactions updated

Return type `tuple`

_update_bank_or_credit(acct, ofx, stmt)

Update a single OFX file for this Bank or Credit account.

Parameters

- **acct** (`biweeklybudget.models.account.Account`) – the Account this statement is for
- **ofx** (`ofxpathre.ofxpathre.Ofx`) – Ofx instance for parsed file
- **stmt** (`biweeklybudget.models.ofx_statement.OFXStatement`) – the OFXStatement for this statement

Returns the OFXStatement object

Return type `biweeklybudget.models.ofx_statement.OFXStatement`

_update_investment(acct, ofx, stmt)

Update a single OFX file for this Investment account.

Parameters

- **acct** (`biweeklybudget.models.account.Account`) – the Account this statement is for
- **ofx** (`ofxpathre.ofxpathre.Ofx`) – Ofx instance for parsed file
- **stmt** (`biweeklybudget.models.ofx_statement.OFXStatement`) – the OFXStatement for this statement

Returns the OFXStatement object

Return type `biweeklybudget.models.ofx_statement.OFXStatement`

get_accounts()

Query the database for all `ofxgetter`-enabled Accounts that have a non-empty `biweeklybudget.models.account.Account.ofxgetter_config` and a non-None `biweeklybudget.models.account.Account.vault_creds_path`. Return a dict of string `Account name` to dict with keys:

- `vault_path` - `vault_creds_path`
- `config` - `ofxgetter_config`
- `id` - `id`
- `cat_memo` - `ofx_cat_memo_to_name`

Returns dict of account names to configuration

Return type dict

update_statement_ofx(acct_id, ofx, mtime=None, filename=None)

Update a single statement for the specified account, from an OFX file.

Parameters

- `acct_id` (`int`) – Account ID that statement is for
- `ofx` (`ofxpath.parse.ofxpath.Ofx`) – Ofx instance for parsed file
- `mtime` (`datetime.datetime`) – OFX file modification time (or current time)
- `filename` (`str`) – OFX file name

Returns 3-tuple of the int ID of the `OFXStatement` created by this run, int count of new `OFXTransaction` created, and int count of `OFXTransaction` updated

Return type tuple

Raises `RuntimeError` on error parsing OFX or unknown account type; `DuplicateFileException` if the file (according to the OFX signon date/time) has already been recorded.

biweeklybudget.ofxapi.remote module

class biweeklybudget.ofxapi.remote.**OfxApiRemote**(`api_base_url`, `ca_bundle=None`, `client_cert_path=None`, `client_key_path=None`)

Bases: object

Remote OFX API client, used by ofxgetter/ofxbackfiller when running on a remote system.

get_accounts()

Query the database for all `ofxgetter`-enabled Accounts that have a non-empty `biweeklybudget.models.account.Account.ofxgetter_config` and a non-None `biweeklybudget.models.account.Account.vault_creds_path`. Return a dict of string `Account name` to dict with keys:

- `vault_path` - `vault_creds_path`
- `config` - `ofxgetter_config`
- `id` - `id`
- `cat_memo` - `ofx_cat_memo_to_name`

Returns dict of account names to configuration

Return type dict

update_statement_ofx(acct_id, ofx, mtime=None, filename=None)

Update a single statement for the specified account, from an OFX file.

Parameters

- **acct_id** (int) – Account ID that statement is for
- **ofx** (ofxpath.parse.ofxpath.Ofx) – Ofx instance for parsed file
- **mtime** (datetime.datetime) – OFX file modification time (or current time)
- **filename** (str) – OFX file name

Returns 3-tuple of the int ID of the *OFXStatement* created by this run, int count of new *OFXTransaction* created, and int count of *OFXTransaction* updated

Return type tuple

Raises RuntimeError on error parsing OFX or unknown account type; DuplicateFileException if the file (according to the OFX signon date/time) has already been recorded.

Submodules

biweeklybudget.backfill_ofx module

class biweeklybudget.backfill_ofx.OfxBackfiller(client, savedir)
Bases: object

Class to backfill OFX in database from files on disk.

_do_account_dir(acct_id, path)

Handle all OFX statements in a per-account directory.

Parameters

- **acct_id** (int) – account database ID
- **path** (str) – absolute path to per-account directory

_do_one_file(acct_id, path)

Parse one OFX file and use OFXUpdater to upsert it into the DB.

Parameters

- **acct_id** (int) – Account ID number
- **path** (str) – absolute path to OFX/QFX file

run()

Main entry point - run the backfill.

biweeklybudget.backfill_ofx.main()

Main entry point - instantiate and run *OfxBackfiller*.

biweeklybudget.backfill_ofx.parse_args()

Parse command-line arguments.

biweeklybudget.biweeklypayperiod module

class biweeklybudget.biweeklypayperiod.**BiweeklyPayPeriod**(*start_date*, *db_session*)
Bases: `object`

This object contains all logic related to working with pay periods, specifically finding a pay period for a given data, and figuring out the start and end dates of pay periods. Sure, the app is called “biweeklybudget” but there’s no reason to hard-code logic all over the place that’s this simple.

_data

Return the object-local data cache dict. Built it if not already present.

Returns object-local data cache

Return type `dict`

_dict_for_sched_trans(t)

Return a dict describing the ScheduledTransaction t. Called from `_trans_dict()`.

The resulting dict will have the following layout:

- **type** (`str`) “Transaction” or “ScheduledTransaction”
- **id** (`int`) the id of the object
- **date** (`date`) the date of the transaction, or None for per-period ScheduledTransactions
- **sched_type** (`str`) for ScheduledTransactions, the schedule type (“monthly”, “date”, or “per period”)
- **sched_trans_id** `None`
- **description** (`str`) the transaction description
- **amount** (`Decimal.Decimal`) the transaction amount
- **budgeted_amount** `None`
- **account_id** (`int`) the id of the Account the transaction is against.
- **account_name** (`str`) the name of the Account the transaction is against.
- **budget_id** (`int`) the id of the Budget the transaction is against.
- **budget_name** (`str`) the name of the Budget the transaction is against.
- **reconcile_id** (`int`) the ID of the TxnReconcile, or None

Parameters `t` (`ScheduledTransaction`) – ScheduledTransaction to describe

Returns common-format dict describing t

Return type `dict`

_dict_for_trans(t)

Return a dict describing the Transaction t. Called from `_trans_dict()`.

The resulting dict will have the following layout:

- **type** (`str`) “Transaction” or “ScheduledTransaction”
- **id** (`int`) the id of the object
- **date** (`date`) the date of the transaction, or None for per-period ScheduledTransactions
- **sched_type** (`str`) for ScheduledTransactions, the schedule type (“monthly”, “date”, or “per period”)

- `sched_trans_id` (`int`) for Transactions, the ScheduledTransaction id that it was created from, or None.
- `description` (`str`) the transaction description
- `amount` (`Decimal.Decimal`) the transaction amount
- `budgeted_amount` (`Decimal.Decimal`) the budgeted amount. This may be None.
- `account_id` (`int`) the id of the Account the transaction is against.
- `account_name` (`str`) the name of the Account the transaction is against.
- `budget_id` (`int`) the id of the Budget the transaction is against.
- `budget_name` (`str`) the name of the Budget the transaction is against.
- `reconcile_id` (`int`) the ID of the TxnReconcile, or None

Parameters `t` (`Transaction`) – transaction to describe

Returns common-format dict describing `t`

Return type `dict`

`_income_budget_ids`

Return a list of all `Budget` IDs for Income budgets.

Returns list of income budget IDs

Return type `list`

`_make_budget_sums()`

Find the sums of all transactions per periodic budget ID ; return a dict where keys are budget IDs and values are per-budget dicts containing:

- `budget_amount` (`Decimal.Decimal`) - the periodic budget `starting_balance`.
- `allocated` (`Decimal.Decimal`) - sum of all `ScheduledTransaction` and `Transaction` amounts against the budget this period. For actual transactions, we use the `budgeted_amount` if present (not None).
- `spent` (`Decimal.Decimal`) - the sum of all actual `Transaction` amounts against the budget this period.
- `trans_total` (`Decimal.Decimal`) - the sum of spent amounts for Transactions that have them, or allocated amounts for ScheduledTransactions.
- `remaining` (`Decimal.Decimal`) - the remaining amount in the budget. This is `budget_amount` minus the greater of `allocated` or `trans_total`. For income budgets, this is always positive.

Returns dict of dicts, transaction sums and amounts per budget

Return type `dict`

`_make_combined_transactions()`

Combine all Transactions and ScheduledTransactions from `self._data_cache` into one ordered list of similar dicts, adding dates to the monthly ScheduledTransactions as appropriate and excluding ScheduledTransactions that have been converted to real Transactions. Store the finished list back into `self._data_cache`.

`_make_overall_sums()`

Return a dict describing the overall sums for this pay period, namely:

- allocated (*Decimal.Decimal*) total amount allocated via *ScheduledTransaction*, *Transaction* (counting the *budgeted_amount* for Transactions that have one), or *Budget* (not counting income budgets).
- spent (*Decimal.Decimal*) total amount actually spent via *Transaction*.
- income (*Decimal.Decimal*) total amount of income allocated this pay period. Calculated value (from *_make_budget_sums()* / *self._data_cache['budget_sums']*) should be negative, but is returned as its positive inverse (absolute value).
- remaining (*Decimal.Decimal*) income minus the greater of allocated or spent for current or future pay periods, or minus spent for pay periods ending in the past (*is_in_past*)

Returns dict describing sums for the pay period

Return type dict

_scheduled_transactions_date()

Return a Query for all *ScheduledTransaction* defined by date (schedule_type == “date”) for this pay period.

Returns Query matching all ScheduledTransactions defined by date, for this pay period.

Return type sqlalchemy.orm.query.Query

_scheduled_transactions_monthly()

Return a Query for all *ScheduledTransaction* defined by day of month (schedule_type == “monthly”) for this pay period.

Returns Query matching all ScheduledTransactions defined by day of month (monthly) for this period.

Return type sqlalchemy.orm.query.Query

_scheduled_transactions_per_period()

Return a Query for all *ScheduledTransaction* defined by number per period (schedule_type == “per period”) for this pay period.

Returns Query matching all ScheduledTransactions defined by number per period, for this pay period.

Return type sqlalchemy.orm.query.Query

_trans_dict(t)

Given a Transaction or ScheduledTransaction, return a dict of a common format describing the object.

The resulting dict will have the following layout:

- **type** (str) “Transaction” or “ScheduledTransaction”
- **id** (int) the id of the object
- **date** (date) the date of the transaction, or None for per-period ScheduledTransactions
- **sched_type** (str) for ScheduledTransactions, the schedule type (“monthly”, “date”, or “per period”)
- **sched_trans_id** (int) for Transactions, the ScheduledTransaction id that it was created from, or None.
- **description** (str) the transaction description
- **amount** (Decimal.Decimal) the transaction amount
- **budgeted_amount** (Decimal.Decimal) the budgeted amount. This may be None.

- account_id (**int**) the id of the Account the transaction is against.
- account_name (**str**) the name of the Account the transaction is against.
- budget_id (**int**) the id of the Budget the transaction is against.
- budget_name (**str**) the name of the Budget the transaction is against.
- reconcile_id (**int**) the ID of the TxnReconcile, or None

Parameters `t` (*Transaction* or *ScheduledTransaction*) – the object to return a dict for

Returns dict describing `t`

Return type `dict`

`_transactions()`

Return a Query for all *Transaction* for this pay period.

Returns Query matching all Transactions for this pay period

Return type `sqlalchemy.orm.query.Query`

`budget_sums`

Return a dict of budget sums; the return value of `_make_budget_sums()`.

Returns dict of dicts, transaction sums and amounts per budget

Return type `dict`

`clear_cache()`

Clear the cached transaction, budget and sum data stored in `self._data_cache` and returned by `_data`.

`end_date`

Return the date of the last day in this pay period. The pay period is generally considered to end at the last instant (i.e. 23:59:59) of this date.

Returns last date in the pay period

Return type `datetime.date`

`filter_query(query, date_prop)`

Filter query for `date_prop` in this pay period. Returns a copy of the query.

e.g. to filter an existing query of *OFXTransaction* for the BiweeklyPayPeriod starting on 2017-01-14:

```
q = # some query here
p = BiweeklyPayPeriod(date(2017, 1, 14))
q = p.filter_query(q, OFXTransaction.date_posted)
```

Parameters

- `query` (`sqlalchemy.orm.query.Query`) – The query to filter
- `date_prop` – the Model's date property, to filter on.

Returns the filtered query

Return type `sqlalchemy.orm.query.Query`

`is_in_past`

`next`

Return the BiweeklyPayPeriod following this one.

Returns next BiweeklyPayPeriod after this one

Return type *BiweeklyPayPeriod*

overall_sums

Return a dict of overall sums; the return value of `_make_overall_sums()`.

Returns dict describing sums for the pay period

Return type *dict*

static period_for_date(dt, db_session)

Given a datetime, return the BiweeklyPayPeriod instance describing the pay period containing this date.

Todo: This is a very naive, poorly-performing implementation.

Parameters

- **dt** (`datetime` or `date`) – datetime or date to find the pay period for
- **db_session** (`sqlalchemy.orm.Session`) – active database session to use for queries

Returns BiweeklyPayPeriod containing the specified date

Return type *BiweeklyPayPeriod*

period_interval

Return the interval between BiweeklyPayPeriods as a timedelta.

Returns interval between BiweeklyPayPeriods

Return type `datetime.timedelta`

period_length

Return the length of a BiweeklyPayPeriod; this is calculated as `period_interval` minus one second.

Returns length of one BiweeklyPayPeriod

Return type `datetime.timedelta`

previous

Return the BiweeklyPayPeriod preceding this one.

Returns previous BiweeklyPayPeriod before this one

Return type *BiweeklyPayPeriod*

start_date

Return the starting date for this pay period. The period is generally considered to start at midnight (00:00) of this date.

Returns start date for pay period

Return type `datetime.date`

transactions_list

Return an ordered list of dicts, each representing a transaction for this pay period. Dicts have keys and values as described in `_trans_dict()`.

Returns ordered list of transaction dicts

Return type `list`

biweeklybudget.cliutils module

```
biweeklybudget.cliutils.set_log_debug(logger)
    set logger level to DEBUG, and debug-level output format, via set_log_level_format().
biweeklybudget.cliutils.set_log_info(logger)
    set logger level to INFO via set_log_level_format().
biweeklybudget.cliutils.set_log_level_format(logger, level, format)
    Set logger level and format.
```

Parameters

- **logger** (`logging.Logger`) – the logger object to set on
- **level** (`int`) – logging level; see the `logging` constants.
- **format** (`str`) – logging formatter format string

biweeklybudget.db module

```
biweeklybudget.db._alembic_get_current_rev(config, script)
    Works sorta like alembic.command.current
```

Parameters `config` – alembic Config

Returns current revision

Return type str

```
biweeklybudget.db.cleanup_db()
    This must be called from all scripts, using
```

```
atexit.register(cleanup_db)
```

```
biweeklybudget.db.db_session = <sqlalchemy.orm.scoping.scoped_session object>
    sqlalchemy.orm.scoping.scoped_session session
```

```
biweeklybudget.db.engine = Engine(sqlite:///memory:)
    The database engine object; return value of sqlalchemy.create_engine().
```

```
biweeklybudget.db.init_db()
```

Initialize the database; call `sqlalchemy.schema.MetaData.create_all()` on the metadata object.

```
biweeklybudget.db.upsert_record(model_class, key_fields, **kwargs)
```

Upsert a record in the database.

`key_fields` is either a string primary key field name (a key in the `kwargs` dict) or a list or tuple of string primary key field names, for compound keys.

If a record can be found matching these keys, it will be updated and committed. If not, a new one will be inserted. Either way, the record is returned.

`sqlalchemy.orm.Session.commit()` is NOT called.

Parameters

- **model_class** (`biweeklybudget.models.base.ModelAsDict`) – the class of model to insert/update
- **key_fields** – The field name(s) (keys in `kwargs`) that make up the primary key. This can be a single string, or a list or tuple of strings for compound keys. The values for these key fields MUST be included in `kwargs`.

- **kwargs** (*dict*) – arguments to provide to the model class constructor, or to update if there is an existing record matching the key.

Returns inserted or updated record; type is an instance of `model_class`

biweeklybudget.db_event_handlers module

`biweeklybudget.db_event_handlers.handle_before_flush(session, flush_context, instances)`

Hook into `before_flush (sqlalchemy.orm.events.SessionEvents.before_flush())` on the DB session, to handle updates that need to be made before persisting data. Currently, this method just calls a number of other methods to handle specific cases:

- `handle_new_transaction()`

Parameters

- **session** (*sqlalchemy.orm.session.Session*) – current database session
- **flush_context** (*sqlalchemy.orm.session.UOWTransaction*) – internal SQLAlchemy object
- **instances** – deprecated

`biweeklybudget.db_event_handlers.handle_new_transaction(session)`

`before_flush` event handler (`sqlalchemy.orm.events.SessionEvents.before_flush()`) on the DB session, to handle creation of *new* Transactions. For updates to existing Transactions, we rely on `handle_trans_amount_change()`.

If the Transaction's `budget` is a `Budget` with `is_periodic` False (i.e. a standing budget), update the Budget's `current_balance` for this transaction.

Parameters `session (sqlalchemy.orm.session.Session)` – current database session

`biweeklybudget.db_event_handlers.handle_trans_amount_change(**kwargs)`

Handle change of `Transaction.actual_amount` for existing instances (`id` is not None). For new instances, we rely on `handle_new_transaction()` called via `handle_before_flush()`.

If the Transaction's `budget` is a `Budget` with `is_periodic` False (i.e. a standing budget), update the Budget's `current_balance` for this transaction.

See: `sqlalchemy.orm.events.AttributeEvents.set()`

Parameters `kwargs (dict)` – keyword arguments

`biweeklybudget.db_event_handlers.init_event_listeners(db_session)`

Initialize/register all SQLAlchemy event listeners.

See <http://docs.sqlalchemy.org/en/latest/orm/events.html>

Parameters `db_session (sqlalchemy.orm.session.Session)` – the Database Session

biweeklybudget.initdb module

`biweeklybudget.initdb.main()`

`biweeklybudget.initdb.parse_args()`

biweeklybudget.interest module

class biweeklybudget.interest.**AdbCompoundedDaily** (*apr*)
Bases: *biweeklybudget.interest._InterestCalculation*

Average Daily Balance method, compounded daily (like American Express).

calculate (*principal*, *first_d*, *last_d*, *transactions*={})
Calculate compound interest for the specified principal.

Parameters

- **principal** (*decimal.Decimal*) – balance at beginning of statement period
- **first_d** (*datetime.date*) – date of beginning of statement period
- **last_d** (*datetime.date*) – last date of statement period
- **transactions** (*dict*) – dict of *datetime.date* to float amount adjust the balance by on the specified dates.

Returns dict describing the result: *end_balance* (float), *interest_paid* (float)

Return type

description = 'Average Daily Balance Compounded Daily (AmEx) '

Human-readable string name of the interest calculation type.

class biweeklybudget.interest.**CCStatement** (*interest_cls*, *principal*, *min_payment_cls*,
billing_period, *transactions*={},
end_balance=None, *interest_amt*=None)

Bases: *object*

Represent a credit card statement (one billing period).

apr

billing_period

Return the Billing Period for this statement.

Returns billing period for this statement

Return type

_BillingPeriod

end_date

interest

minimum_payment

Return the minimum payment for the next billing cycle.

Returns minimum payment for the next billing cycle

Return type

decimal.Decimal

next_with_transactions

(*transactions*={}))
Return a new CCStatement reflecting the next billing period, with a payment of *amount* applied to it.

Parameters **transactions** (*dict*) – dict of transactions, *datetime.date* to *Decimal*

Returns next period statement, with transactions applied

Return type

CCStatement

pay

(*amount*)
Return a new CCStatement reflecting the next billing period, with a payment of *amount* applied to it at the middle of the period.

Parameters `amount` (`decimal.Decimal`) – amount to pay during the next statement period

Returns next period statement, with payment applied

Return type `CCStatement`

`principal`

`start_date`

```
class biweeklybudget.interest.FixedPaymentMethod(max_total_payment=None,      in-
                                                 increases={}, onetimes={})
```

Bases: `biweeklybudget.interest._PayoffMethod`

TESTING ONLY - pay the same amount on every statement.

`description = 'TESTING ONLY - Fixed Payment for All Statements'`

`find_payments(statements)`

Given a list of statements, return a list of payment amounts to make on each of the statements.

Parameters `statements` (`list`) – statements to pay, list of `CCStatement`

Returns list of payment amounts to make, same order as `statements`

Return type `list`

`show_in_ui = False`

```
class biweeklybudget.interest.HighestBalanceFirstMethod(max_total_payment=None,      in-
                                                       increases={}, one-
                                                       times={})
```

Bases: `biweeklybudget.interest._PayoffMethod`

Pay statements off from highest to lowest balance.

`description = 'Highest to Lowest Balance'`

`find_payments(statements)`

Given a list of statements, return a list of payment amounts to make on each of the statements.

Parameters `statements` (`list`) – statements to pay, list of `CCStatement`

Returns list of payment amounts to make, same order as `statements`

Return type `list`

`show_in_ui = True`

```
class biweeklybudget.interest.HighestInterestRateFirstMethod(max_total_payment=None,      in-
                                                               increases={}, one-
                                                               times={})
```

Bases: `biweeklybudget.interest._PayoffMethod`

Pay statements off from highest to lowest interest rate.

`description = 'Highest to Lowest Interest Rate'`

`find_payments(statements)`

Given a list of statements, return a list of payment amounts to make on each of the statements.

Parameters `statements` (`list`) – statements to pay, list of `CCStatement`

Returns list of payment amounts to make, same order as `statements`

Return type `list`

`show_in_ui = True`

```
biweeklybudget.interest.INTEREST_CALCULATION_NAMES = {'AdbCompoundedDaily': {'doc': 'Aver...'}}
```

Dict mapping interest calculation class names to their description and docstring.

```
class biweeklybudget.interest.InterestHelper(db_sess, increases={}, onetimes={})
```

Bases: `object`

```
_calc_payoff_method(cls)
```

Calculate payoffs using one method.

Parameters `cls` (`biweeklybudget.interest._PayoffMethod`) – payoff method class

Returns Dict with integer `account_id` as the key, and values are dicts with keys “payoff_months” (int), “total_payments” (Decimal), “total_interest” (Decimal), “next_payment” (Decimal).

Return type `dict`

```
_get_credit_accounts()
```

Return a dict of `account_id` to `Account` for all Credit type accounts with OFX data present.

Returns dict of account_id to Account instance

Return type `dict`

```
_make_statements(accounts)
```

Make `CCStatement` instances for each account; return a dict of `account_id` to CCStatement instance.

Parameters `accounts` (`dict`) – dict of (int) account_id to Account instance

Returns dict of (int) account_id to CCStatement instance

Return type `dict`

```
accounts
```

Return a dict of `account_id` to `Account` for all Credit type accounts with OFX data present.

Returns dict of account_id to Account instance

Return type `dict`

```
calculate_payoffs()
```

Calculate payoffs for each account/statement.

Returns dict of payoff information. Keys are payoff method names. Values are dicts, with keys “description” (str description of the payoff method), “doc” (the docstring of the class), and “results”. The “results” dict has integer `account_id` as the key, and values are dicts with keys “payoff_months” (int), “total_payments” (Decimal), “total_interest” (Decimal) and `next_payment` (Decimal).

Return type `dict`

```
min_payments
```

Return a dict of `account_id` to minimum payment for the latest statement, for each account.

Returns dict of `account_id` to minimum payment (Decimal)

Return type `dict`

```
class biweeklybudget.interest.LowestBalanceFirstMethod(max_total_payment=None, increases={}, onetimes{})
```

Bases: `biweeklybudget.interest._PayoffMethod`

Pay statements off from lowest to highest balance, a.k.a. the “snowball” method.

```
description = 'Lowest to Highest Balance (a.k.a. Snowball Method)'
```

find_payments (statements)

Given a list of statements, return a list of payment amounts to make on each of the statements.

Parameters **statements** (*list*) – statements to pay, list of *CCStatement*

Returns list of payment amounts to make, same order as **statements**

Return type *list*

show_in_ui = True

```
class biweeklybudget.interest.LowestInterestRateFirstMethod(max_total_payment=None,  
                                                               increases={}, one-  
                                                               times={})
```

Bases: *biweeklybudget.interest._PayoffMethod*

Pay statements off from lowest to highest interest rate.

description = 'Lowest to Highest Interest Rate'

find_payments (statements)

Given a list of statements, return a list of payment amounts to make on each of the statements.

Parameters **statements** (*list*) – statements to pay, list of *CCStatement*

Returns list of payment amounts to make, same order as **statements**

Return type *list*

show_in_ui = True

```
biweeklybudget.interest.MIN_PAYMENT_FORMULA_NAMES = {'MinPaymentAmEx': {'doc': 'Interest  
Dict mapping Minimum Payment Formula class names to their description and docstring.'}}
```

```
class biweeklybudget.interest.MinPaymentAmEx
```

Bases: *biweeklybudget.interest._MinPaymentFormula*

Interest on last statement plus 1% of balance, or \$35 if balance is less than \$35.

calculate (*balance, interest*)

Calculate the minimum payment for a statement with the given balance and interest amount.

Parameters

- **balance** (*decimal.Decimal*) – balance amount for the statement

- **interest** (*decimal.Decimal*) – interest charged for the statement period

Returns minimum payment for the statement

Return type *decimal.Decimal*

description = 'AmEx – Greatest of Interest Plus 1% of Principal, or \$35'

human-readable string description of the formula

```
class biweeklybudget.interest.MinPaymentCiti
```

Bases: *biweeklybudget.interest._MinPaymentFormula*

Greater of: - \$25; - The new balance, if it's less than \$25; - 1 percent of the new balance, plus the current statement's interest charges or minimum interest charges, plus late fees; - 1.5% of the new balance, rounded to the nearest dollar amount.

In all cases, add past fees and finance charges due, plus any amount in excess of credit line.

calculate (*balance, interest*)

Calculate the minimum payment for a statement with the given balance and interest amount.

Parameters

- **balance** (`decimal.Decimal`) – balance amount for the statement
- **interest** (`decimal.Decimal`) – interest charged for the statement period

Returns minimum payment for the statement

Return type `decimal.Decimal`

```
description = 'Citi - Greatest of 1.5% of Principal, or 1% of Principal plus interest'
human-readable string description of the formula
```

```
class biweeklybudget.interest.MinPaymentDiscover
```

```
Bases: biweeklybudget.interest._MinPaymentFormula
```

Greater of: - \$35; or - 2% of the New Balance shown on your billing statement; or - \$20, plus any of the following charges as shown on your billing statement: fees for any debt protection product that you enrolled in on or after 2/1/2015; Interest Charges; and Late Fees.

```
calculate(balance, interest)
```

Calculate the minimum payment for a statement with the given balance and interest amount.

Parameters

- **balance** (`decimal.Decimal`) – balance amount for the statement
- **interest** (`decimal.Decimal`) – interest charged for the statement period

Returns minimum payment for the statement

Return type `decimal.Decimal`

```
description = 'Discover - Greatest of 2% of Principal, or $20 plus Interest, or $35'
human-readable string description of the formula
```

```
class biweeklybudget.interest.MinPaymentMethod(max_total_payment=None,
```

```
increases={}, onetimes={})
```

```
Bases: biweeklybudget.interest._PayoffMethod
```

Pay only the minimum on each statement.

```
description = 'Minimum Payment Only'
```

```
find_payments(statements)
```

Given a list of statements, return a list of payment amounts to make on each of the statements.

Parameters `statements` (`list`) – statements to pay, list of `CCStatement`

Returns list of payment amounts to make, same order as `statements`

Return type `list`

```
show_in_ui = True
```

```
biweeklybudget.interest.PAYOFF_METHOD_NAMES = {'FixedPaymentMethod': {'doc': 'TESTING ONLY'}}
```

Dict mapping Payoff Method class names to their description and docstring.

```
class biweeklybudget.interest.SimpleInterest(apr)
```

```
Bases: biweeklybudget.interest._InterestCalculation
```

Simple interest, charged on balance at the end of the billing period.

```
calculate(principal, first_d, last_d, transactions={})
```

Calculate compound interest for the specified principal.

Parameters

- **principal** (`decimal.Decimal`) – balance at beginning of statement period

- **first_d** (`datetime.date`) – date of beginning of statement period
- **last_d** (`datetime.date`) – last date of statement period
- **transactions** (`dict`) – dict of `datetime.date` to float amount adjust the balance by on the specified dates.

Returns dict describing the result: `end_balance` (float), `interest_paid` (float)

Return type `dict`

description = 'Interest charged once on the balance at end of period.'
Human-readable string name of the interest calculation type.

class `biweeklybudget.interest._BillingPeriod(end_date, start_date=None)`

Bases: `object`

description = `None`

human-readable string description of the billing period type

end_date

next_period

Return the next billing period after this one.

Returns next billing period

Return type `_BillingPeriod`

payment_date

prev_period

Return the previous billing period before this one.

Returns previous billing period

Return type `_BillingPeriod`

start_date

class `biweeklybudget.interest._InterestCalculation(apr)`

Bases: `object`

apr

calculate (`principal, first_d, last_d, transactions={}`)

Calculate compound interest for the specified principal.

Parameters

- **principal** (`decimal.Decimal`) – balance at beginning of statement period
- **first_d** (`datetime.date`) – date of beginning of statement period
- **last_d** (`datetime.date`) – last date of statement period
- **transactions** (`dict`) – dict of `datetime.date` to float amount adjust the balance by on the specified dates.

Returns dict describing the result: `end_balance` (float), `interest_paid` (float)

Return type `dict`

description = `None`

Human-readable string name of the interest calculation type.

class `biweeklybudget.interest._MinPaymentFormula`

Bases: `object`

calculate(*balance, interest*)

Calculate the minimum payment for a statement with the given balance and interest amount.

Parameters

- **balance** (*decimal.Decimal*) – balance amount for the statement
- **interest** (*decimal.Decimal*) – interest charged for the statement period

Returns minimum payment for the statement

Return type *decimal.Decimal*

description = None

human-readable string description of the formula

```
class biweeklybudget.interest._PayoffMethod(max_total_payment=None,      increases={},
                                             onetimes={})
```

Bases: *object*

A payoff method for multiple cards; a method of figuring out how much to pay on each card, each month.

description = None

human-readable string name of the payoff method

find_payments(*statements*)

Given a list of statements, return a list of payment amounts to make on each of the statements.

Parameters **statements** (*list*) – statements to pay, list of *CCStatement*

Returns list of payment amounts to make, same order as *statements*

Return type *list*

max_total_for_period(*period*)

Given a *_BillingPeriod*, calculate the maximum total payment for that period, including both *self._max_total* and the increases and onetimes specified on the class constructor.

Parameters **period** (*_BillingPeriod*) – billing period to get maximum total payment for

Returns maximum total payment for the period

Return type *decimal.Decimal*

```
biweeklybudget.interest.calculate_payoffs(payment_method, statements)
```

Calculate the amount of time (in years) and total amount of money required to pay off the cards associated with the given list of statements. Return a list of (*float* number of years, *decimal.Decimal* amount paid, *decimal.Decimal* first payment amount) tuples for each item in *statements*.

Parameters

- **payment_method** (*_PayoffMethod*) – method used for calculating payment amount to make on each statement; subclass of *_PayoffMethod*
- **statements** (*list*) – list of *CCStatement* objects to pay off.

Returns list of (*float* number of billing periods, *decimal.Decimal* amount paid, *decimal.Decimal* first payment amount) tuples for each item in *statements*

Return type *list*

```
biweeklybudget.interest.subclass_dict(klass)
```

biweeklybudget.load_data module

```
biweeklybudget.load_data.main()  
biweeklybudget.load_data.parse_args()
```

biweeklybudget.ofxgetter module

```
class biweeklybudget.ofxgetter.OfxGetter(client, savedir='/.')  
Bases: object
```

```
_get_ofx_scraper(account_name, days=30)
```

Get OFX via a ScreenScraper subclass.

Parameters

- **account_name** (*str*) – account name
- **days** (*int*) – number of days of data to download

Returns OFX string

Return type *str*

```
_ofx_to_db(account_name, fname, ofxdata)
```

Put OFX Data to the DB

Parameters

- **account_name** (*str*) – account name to download
- **ofxdata** (*str*) – raw OFX data
- **fname** (*str*) – filename OFX was written to

```
_write_ofx_file(account_name, ofxdata)
```

Write OFX data to a file.

Parameters

- **account_name** (*str*) – account name
- **ofxdata** (*str*) – raw OFX data string

Returns name of the file that was written

Return type *str*

```
static accounts(client)
```

Return a dict of account information of ofxgetter-enabled accounts, str account name to dict of information about the account.

Parameters **client** (Instance of *OfxApiLocal* or *OfxApiRemote*) – API client

Returns dict of account information; see *get_accounts()* for details.

Return type *dict*

```
get_ofx(account_name, write_to_file=True, days=30)
```

Download OFX from the specified account. Return it as a string.

Parameters

- **account_name** (*str*) – account name to download

- **write_to_file** (*bool*) – if True, also write to a file named “<account_name>_<date stamp>.ofx”
- **days** (*int*) – number of days of data to download

Returns OFX string

Return type str

```
biweeklybudget.ofxgetter.main()  
biweeklybudget.ofxgetter.parse_args()
```

biweeklybudget.prime_rate module

```
class biweeklybudget.prime_rate.PrimeRateCalculator(db_session)  
Bases: object  
  
_get_prime_rate()  
    Get the US Prime Rate from MarketWatch; update the DB and return the value.  
  
    Returns current US Prime Rate  
  
    Return type decimal.Decimal  
  
_rate_from_marketwatch()  
  
calculate_apr(margin)  
    Calculate an APR based on the prime rate.  
  
    Parameters margin (decimal.Decimal) – margin added to Prime Rate to get APR  
  
    Returns effective APR  
  
    Return type decimal.Decimal  
  
prime_rate  
    Return the current US Prime Rate  
  
    Returns current US Prime Rate  
  
    Return type decimal.Decimal
```

biweeklybudget.screencrawler module

```
class biweeklybudget.screencrawler.ScreenScraper(savedir='.', screenshot=False)  
Bases: object  
  
Base class for screen-scraping bank/financial websites.  
  
_post_screenshot()  
  
_pre_screenshot()  
  
do_screenshot()  
    take a debug screenshot  
  
doc_readystate_is_complete(foo)  
    return true if document is ready/complete, false otherwise  
  
error_screenshot(fname=None)
```

```
get_browser (browser_name)
    get a webdriver browser instance

jquery_finished (foo)
    return true if jQuery.active == 0 else false

load_cookies (cookie_file)
    Load cookies from a JSON cookie file on disk. This file is not the format used natively by PhantomJS, but
    rather the JSON-serialized representation of the dict returned by selenium.webdriver.remote.
    webdriver.WebDriver.get_cookies ().

    Cookies are loaded via selenium.webdriver.remote.webdriver.WebDriver.
    add_cookie ()

    Parameters cookie_file (str) – path to the cookie file on disk

save_cookies (cookie_file)
    Save cookies to a JSON cookie file on disk. This file is not the format used natively by PhantomJS, but
    rather the JSON-serialized representation of the dict returned by selenium.webdriver.remote.
    webdriver.WebDriver.get_cookies ().

    Parameters cookie_file (str) – path to the cookie file on disk

wait_for_ajax_load (timeout=20)
    Function to wait for an ajax event to finish and trigger page load, like the Janrain login form.
    Pieced together from http://stackoverflow.com/a/15791319
    timeout is in seconds

xhr_get_url (url)
    use JS to download a given URL, return its contents

xhr_post_urlencoded (url, data, headers={})
    use JS to download a given URL, return its contents
```

biweeklybudget.settings module

```
biweeklybudget.settings.BIWEEKLYBUDGET_TEST_TIMESTAMP = None
int - FOR ACCEPTANCE TESTS ONLY - This is used to “fudge” the current time to the specified integer
timestamp. Used for acceptance tests only. Do NOT set this outside of acceptance testing.

biweeklybudget.settings.CURRENCY_CODE = 'USD'
An ISO 4217 Currency Code specifying the currency to use for all monetary amounts, i.e. “USD”, “EUR”, etc.
This setting only effects how monetary values are displayed in the UI, logs, etc. Currently defaults to “USD”.
For further information, see Currency Formatting and Localization.

biweeklybudget.settings.DB_CONNSTRING = 'sqlite:///memory:'
string - SQLAlchemy database connection string. See the SQLAlchemy Database URLs docs for further information.

biweeklybudget.settings.DEFAULT_ACCOUNT_ID = 1
int - Account ID to show first in dropdown lists. This must be the database ID of a valid account.

biweeklybudget.settings.DISTANCE_UNIT = 'Miles'
The full written name of your unit of distance for fuel economy calculations and the Fuel Log. As an example,
Miles or Kilometers.

biweeklybudget.settings.DISTANCE_UNIT_ABBREVIATION = 'Mi.'
Abbreviation of biweeklybudget.settings.DISTANCE\_UNIT, such as Mi. or KM.
```

```
biweeklybudget.settings.FUEL_BUDGET_ID = 1
int - Budget ID to select as default when inputting Fuel Log entries. This must be the database ID of a valid budget.
```

```
biweeklybudget.settings.FUEL_ECO_ABBREVIATION = 'MPG'
Abbreviation for your distance-per-volume fuel economy measurement, such as MPG or KM/L.
```

```
biweeklybudget.settings.FUEL_VOLUME_ABBREVIATION = 'Gal.'
Abbreviation of biweeklybudget.settings.FUEL_VOLUME_UNIT, such as Gal. or L.
```

```
biweeklybudget.settings.FUEL_VOLUME_UNIT = 'Gallons'
The full written name of your unit of measure for volume of fuel, to be used for the Fuel Log feature. As an example, Gallons or Litres.
```

```
biweeklybudget.settings.LOCALE_NAME = 'en_US'
A RFC 5646 / BCP 47 Language Tag with a Region suffix to use for number (currency) formatting, i.e. "en_US", "en_GB", "de_DE", etc. If this is not specified (None), it will be looked up from environment variables in the following order: LC_ALL, LC_MONETARY, LANG. If none of those variables are set to a valid locale name (not including the "C" locale, which does not specify currency formatting) and this variable is not set, the application will default to "en_US". This setting only effects how monetary values are displayed in the UI, logs, etc. For further information, see Currency Formatting and Localization.
```

```
biweeklybudget.settings.PAY_PERIOD_START_DATE = datetime.date(2017, 3, 17)
datetime.date - The starting date of one pay period (generally the first pay period represented in data in this app). The dates of all pay periods will be determined based on an interval from this date. This must be specified in Y-m-d format (i.e. parsable by datetime.datetime.strptime() with %Y-%m-%d format).
```

```
biweeklybudget.settings.RECONCILE_BEGIN_DATE = datetime.date(2017, 1, 1)
datetime.date - When listing unreconciled transactions that need to be reconciled, any transaction before this date will be ignored. This must be specified in Y-m-d format (i.e. parsable by datetime.datetime.strptime() with %Y-%m-%d format).
```

```
biweeklybudget.settings.STALE_DATA_TIMedelta = datetime.timedelta(2)
datetime.timedelta - Time interval beyond which OFX data for accounts will be considered old/stale. This must be specified as a number (integer) that will be converted to a number of days.
```

```
biweeklybudget.settings.STATEMENTS_SAVE_PATH = '/home/docs/ofx'
string - (optional) Filesystem path to download OFX statements to, and for backfill_ofx to read them from.
```

```
biweeklybudget.settings.TOKEN_PATH = 'vault_token.txt'
string - (optional) Filesystem path to read Vault token from, for OFX credentials.
```

```
biweeklybudget.settings.VAULT_ADDR = 'http://127.0.0.1:8200'
string - (optional) Address to connect to Vault at, for OFX credentials.
```

biweeklybudget.settings_example module

```
biweeklybudget.settings_example.DB_CONNSTRING = 'sqlite:///memory:'
SQLAlchemy database connection string. Note that the value given in generated documentation is the value used in TravisCI, not the real default.
```

```
biweeklybudget.settings_example.DEFAULT_ACCOUNT_ID = 1
Account ID to show first in dropdown lists
```

```
biweeklybudget.settings_example.FUEL_BUDGET_ID = 1
int - Budget ID to select as default when inputting Fuel Log entries. This must be the database ID of a valid budget.
```

biweeklybudget.settings_example.PAY_PERIOD_START_DATE = `datetime.date(2017, 3, 17)`
The starting date of one pay period. The dates of all pay periods will be determined based on an interval from this date.

biweeklybudget.settings_example.RECONCILE_BEGIN_DATE = `datetime.date(2017, 1, 1)`
When listing unreconciled transactions that need to be reconciled, any `OFXTransaction` before this date will be ignored.

biweeklybudget.settings_example.STALE_DATA_TIMedelta = `datetime.timedelta(2)`
`datetime.timedelta` beyond which OFX data will be considered old

biweeklybudget.settings_example.STATEMENTS_SAVE_PATH = '`/home/docs/ofx'`
Path to download OFX statements to, and for backfill_ofx to read them from

biweeklybudget.settings_example.TOKEN_PATH = '`vault_token.txt`'
Path to read Vault token from, for OFX credentials

biweeklybudget.settings_example.VAULT_ADDR = '`http://127.0.0.1:8200`'
Address to connect to Vault at, for OFX credentials

biweeklybudget.utils module

biweeklybudget.utils.date_suffix(`n`)
Given an integer day of month (1 <= n <= 31), return that number with the appropriate suffix (st|nd|rd|th).

From: <http://stackoverflow.com/a/5891598/211734>

Parameters `n` (`int`) – Integer day of month

Returns `n` with the appropriate suffix

Return type `str`

biweeklybudget.utils.decode_json_datetime(`d`)
Return a `datetime.datetime` for a `datetime` that was serialized with `MagicJSONEncoder`.

Parameters `d` (`dict`) – dict from deserialized JSON

Returns `datetime` represented by dict

Return type `datetime.datetime`

biweeklybudget.utils.utcnow()
Return the current `datetime` as a timezone-aware `DateTimne` object in UTC.

Returns current `datetime`

Return type `datetime.datetime`

biweeklybudget.utils.fix_werkzeug_logger()
Remove the werkzeug logger StreamHandler (call from `app.py`).

With Werkzeug at least as of 0.12.1, `werkzeug._internal._log` sets up its own StreamHandler if logging isn't already configured. Because we're using the `flask` command line wrapper, that will ALWAYS be imported (and executed) before we can set up our own logger. As a result, to fix the duplicate log messages, we have to go back and remove that StreamHandler.

biweeklybudget.utils fmt_currency(`amt`)
Using `LOCALE_NAME` and `CURRENCY_CODE`, return `amt` formatted as currency.

Parameters `amt` – The amount to format; any numeric type.

Returns `amt` formatted for the appropriate locale and currency

Return type str

```
biweeklybudget.utils.in_directory(*args, **kwds)
```

biweeklybudget.vault module

```
exception biweeklybudget.vault.SecretMissingException(path)
```

Bases: exceptions.Exception

```
class biweeklybudget.vault.Vault(addr=None, token_path=None)
```

Bases: object

Provides simpler access to Vault

```
read(secret_path)
```

Read and return a secret from Vault. Return only the data portion.

Parameters secret_path (str) – path to read in Vault

Returns secret data

Return type dict

biweeklybudget.version module

biweeklybudget.wishlist2project module

```
class biweeklybudget.wishlist2project.WishlistToProject
```

Bases: object

```
_do_project(list_url, project)
```

Update a project with information from its wishlist.

Parameters

- list_url (str) – Amazon wishlist URL
- project (Project) – the project to update

Returns whether or not the update was successful

Return type bool

```
_get_wishlist_projects()
```

Find all projects with descriptions that begin with a wishlist URL.

Returns list of (url, Project object) tuples

Return type list

```
_project_items(proj)
```

Return all of the BoMItems for the specified project, as a dict of URL to BoMItem.

Parameters proj (Project) – the project to get items for

Returns item URLs to BoMItems

Return type dict

```
static _url_is_wishlist(url)
```

Determine if the given string or URL matches a wishlist.

Parameters url (str) – URL or string to test

Returns whether url is a wishlist URL

Return type bool

`_wishlist_items(list_url)`

Get the items on the specified wishlist.

Parameters list_url (str) – wishlist URL

Returns dict of item URL to item details dict

Return type dict

`run()`

Run the synchronization.

Returns 2-tuple; count of successful syncs, total count of projects with associated wishlists

Return type tuple

`biweeklybudget.wishlist2project.main()`

`biweeklybudget.wishlist2project.parse_args()`

5.10 UI JavaScript Docs

5.10.1 Files

`jsdoc.accounts_modal`

File: biweeklybudget/flaskapp/static/js/accounts_modal.js

`accountModal(id, dataTableObj)`

Show the modal popup, populated with information for one account. Uses `accountModalDivFillAndShow()` as ajax callback.

Arguments

- `id (number)` – the ID of the account to show modal for, or null to show a modal to add a new account.
- `dataTableObj (Object / null)` – passed on to `handleForm()`

`accountModalDivFillAndShow(msg)`

Ajax callback to fill in the modalDiv with data on a account. Callback for ajax call in `accountModal()`.

`accountModalDivForm()`

Generate the HTML for the form on the Modal

`accountModalDivHandleType()`

Handle change of the “Type” radio buttons on the modal

`jsdoc.bom_items`

File: biweeklybudget/flaskapp/static/js/bom_items.js

`reloadProject()`

Reload the top-level project information on the page.

jsdoc.bom_items_modal

File: biweeklybudget/flaskapp/static/js/bom_items_modal.js

bomItemModal (*id*)

Show the BoM Item modal popup, optionally populated with information for one BoM Item. This function calls `bomItemModalDivForm()` to generate the form HTML, `bomItemModalDivFillAndShow()` to populate the form for editing, and `handleForm()` to handle the Submit action.

Arguments

- **`id`** (*number*) – the ID of the BoM Item to show a modal for, or null to show modal to add a new Transaction.

bomItemModalDivFillAndShow (*msg*)

Ajax callback to fill in the modalDiv with data on a BoM Item.

bomItemModalDivForm ()

Generate the HTML for the form on the Modal

jsdoc.budget_transfer_modal

File: biweeklybudget/flaskapp/static/js/budget_transfer_modal.js

budgetTransferDivForm ()

Generate the HTML for the form on the Modal

budgetTransferModal (*txfr_date*)

Show the modal popup for transferring between budgets. Uses `budgetTransferDivForm()` to generate the form.

Arguments

- **`txfr_date`** (*string*) – The date, as a “yyyy-mm-dd” string, to default the form to. If null or undefined, will default to BIWEEKLYBUDGET_DEFAULT_DATE.

jsdoc.budgets_modal

File: biweeklybudget/flaskapp/static/js/budgets_modal.js

budgetModal (*id*, *dataTableObj*)

Show the modal popup, populated with information for one Budget. Uses `budgetModalDivFillAndShow()` as ajax callback.

Arguments

- **`id`** (*number*) – the ID of the Budget to show modal for, or null to show a modal to add a new Budget.
- **`dataTableObj`** (*Object / null*) – passed on to `handleForm()`

budgetModalDivFillAndShow (*msg*)

Ajax callback to fill in the modalDiv with data on a budget. Callback for ajax call in `budgetModal()`.

budgetModalDivForm ()

Generate the HTML for the form on the Modal

budgetModalDivHandleType ()

Handle change of the “Type” radio buttons on the modal

jsdoc.credit_payoffs

File: biweeklybudget/flaskapp/static/js/credit_payoffs.js

addIncrease (settings)

Link handler to add another “starting on, increase payments by” form to the credit payoff page.

addOnetime (settings)

Link handler to add another one time payment form to the credit payoff page.

loadSettings ()

Load settings from embedded JSON. Called on page load.

nextIndex (prefix)

Return the next index for the form with an ID beginning with a given string.

Arguments

- **prefix** (*string*) – The prefix of the form IDs.

Returns int – next form index

recalcPayoffs ()

Bottom handler to serialize and submit the forms, to save user input and recalculate the payoff amounts.

removeIncrease (idx)

Remove the specified Increase form.

removeOnetime (idx)

Remove the specified Onetime form.

serializeForms ()

Serialize the form data into an object and return it.

Returns Object – serialized forms.

setChanged ()

Event handler to activate the “Save & Recalculate” button when user input fields have changed.

jsdoc.custom

File: biweeklybudget/flaskapp/static/js/custom.js

fmt_currency (value)

Format a float as currency. If value is null, return . Otherwise, construct a new instance of `Intl.NumberFormat` and use it to format the currency to a string. The formatter is called with the `LOCALE_NAME` and `CURRENCY_CODE` variables, which are templated into the header of `base.html` using the values specified in the Python settings module.

Arguments

- **value** (*number*) – the number to format

Returns string – The number formatted as currency

fmt_null (o)

Format a null object as “”

Arguments

- **o** (*Object / null*) – input value

Returns Object|String – o if not null, if null

isofromat (*d*)
Format a javascript Date as ISO8601 YYYY-MM-DD

Arguments

- **d** (*Date*) – the date to format

Returns **string** – YYYY-MM-DD

jsdoc.formBuilder

File: biweeklybudget/flaskapp/static/js/formBuilder.js

FormBuilder (*id*)
Create a new FormBuilder to generate an HTML form

Arguments

- **id** (*String*) – The form HTML element ID.

FormBuilder.**addCheckbox** (*id, name, label, checked*)

Add a checkbox to the form.

Arguments

- **id** (*String*) – The id of the form element
- **name** (*String*) – The name of the form element
- **label** (*String*) – The label text for the form element
- **checked** (*Boolean*) – Whether to default to checked or not

Returns **FormBuilder** – this

FormBuilder.**addCurrency** (*id, name, label, options*)

Add a text input for currency to the form.

Arguments

- **id** (*String*) – The id of the form element
- **name** (*String*) – The name of the form element
- **label** (*String*) – The label text for the form element
- **options** (*Object*) –
- **options.htmlClass** (*String*) – The HTML class to apply to the element; defaults to `form-control`.
- **options.helpBlock** (*String*) – Content for block of help text after input; defaults to null.
- **options.groupHtml** (*String*) – Additional HTML to add to the outermost form-group div. This is where we'd usually add a default style/display. Defaults to null.

Returns **FormBuilder** – this

FormBuilder.**addDatePicker** (*id, name, label, options*)

Add a date picker input to the form.

Arguments

- **id** (*String*) – The id of the form element
- **name** (*String*) – The name of the form element

- **label** (*String*) – The label text for the form element
- **options** (*Object*) –
- **options.groupHtml** (*String*) – Additional HTML to add to the outermost

Returns **FormBuilder** – this

FormBuilder.addHTML (*content*)

Add a string of HTML to the form.

Arguments

- **content** (*String*) – HTML

Returns **FormBuilder** – this

FormBuilder.addHidden (*id, name, value*)

Add a hidden input to the form.

Arguments

- **id** (*String*) – The id of the form element
- **name** (*String*) – The name of the form element
- **value** (*String*) – The value of the form element

Returns **FormBuilder** – this

FormBuilder.addLabelToValueSelect (*id, name, label, selectOptions, defaultValue, addNone, options*)

Add a select element to the form, taking an Object of options where keys are the labels and values are the values.

This is a convenience wrapper around *budgetTransferDivForm()*.

Arguments

- **id** (*String*) – The id of the form element
- **name** (*String*) – The name of the form element
- **label** (*String*) – The label text for the form element
- **selectOptions** (*Object*) – the options for the select, label to value
- **defaultValue** (*String*) – A value to select as the default
- **addNone** (*Boolean*) – If true, prepend an option with a value of “None” and an empty label.
- **options** (*Object*) – Options for rendering the control. Passed through unmodified to *FormBuilder.addSelect()*; see that for details.

Returns **FormBuilder** – this

FormBuilder.addP (*content*)

Add a paragraph (p tag) to the form.

Arguments

- **content** (*String*) – The content of the p tag.

Returns **FormBuilder** – this

FormBuilder.addRadioInline (*name, label, options*)

Add an inline radio button set to the form.

Options is an Array of Objects, each object having keys **id**, **value** and **label**. Optional keys are **checked** (Boolean) and **onchange**, which will have its value placed literally in the HTML.

Arguments

- **name** (*String*) – The name of the form element
- **label** (*String*) – The label text for the form element
- **options** (*Array*) – the options for the select; array of objects each having the following attributes:
 - **options.id** (*String*) – the ID for the option
 - **options.value** (*String*) – the value for the option
 - **options.label** (*String*) – the label for the option
 - **options.checked** (*Boolean*) – whether the option should be checked by default (*optional; defaults to false*)
 - **options.inputHtml** (*String*) – extra HTML string to include in the actual `input` element (*optional; defaults to null*)

Returns `FormBuilder` – this

`FormBuilder.addSelect(id, name, label, selectOptions, options)`

Add a select element to the form.

Arguments

- **id** (*String*) – The id of the form element
- **name** (*String*) – The name of the form element
- **label** (*String*) – The label text for the form element
- **selectOptions** (*Array*) – the options for the select, array of objects (order is preserved) each having the following attributes:
 - **selectOptions.label** (*String*) – the label for the option
 - **selectOptions.value** (*String*) – the value for the option
 - **selectOptions.selected** (*Boolean*) – whether the option should be the default selected value (*optional; defaults to False*)
- **options** (*Object*) –
- **options.htmlClass** (*String*) – The HTML class to apply to the element; defaults to `form-control`.
- **options.helpBlock** (*String*) – Content for block of help text after input; defaults to null.
- **options.groupHtml** (*String*) – Additional HTML to add to the outermost form-group div. This is where we'd usually add a default style/display. Defaults to null.

Returns `FormBuilder` – this

`FormBuilder.addText(id, name, label, options)`

Add a text input to the form.

Arguments

- **id** (*String*) – The id of the form element
- **name** (*String*) – The name of the form element
- **label** (*String*) – The label text for the form element

- **options** (*Object*) –
- **options.groupHtml** (*String*) – Additional HTML to add to the outermost
- **options.inputHtml** (*String*) – extra HTML string to include in the actual `input` element (*optional; defaults to null*)
- **options.helpBlock** (*String*) – Content for block of help text after input; defaults to null.

Returns `FormBuilder` – this

`FormBuilder.addTextArea(id, name, label, options)`

Add a Text Area to the form.

Arguments

- **id** (*String*) – The id of the form element
- **name** (*String*) – The name of the form element
- **label** (*String*) – The label text for the form element
- **options** (*Object*) –
- **options.groupHtml** (*String*) – Additional HTML to add to the outermost
- **options.inputHtml** (*String*) – extra HTML string to include in the actual `input` element (*optional; defaults to null*)
- **options.helpBlock** (*String*) – Content for block of help text after input; defaults to null.

Returns `FormBuilder` – this

`FormBuilder.render()`

Return complete rendered HTML for the form.

Returns `String` – form HTML

jsdoc.forms

File: biweeklybudget/flaskapp/static/js/forms.js

handleForm (*container_id, form_id, post_url, dataTableObj*)

Generic function to handle form submission with server-side validation.

See the Python server-side code for further information.

Arguments

- **container_id** (*string*) – The ID of the container element (div) that is the visual parent of the form. On successful submission, this element will be emptied and replaced with a success message.
- **form_id** (*string*) – The ID of the form itself.
- **post_url** (*string*) – Relative URL to post form data to.
- **dataTableObj** (*Object*) – passed on to `handleFormSubmitted()`

handleFormError (*jqXHR, textStatus, errorThrown, container_id, form_id*)

Handle an error in the HTTP request to submit the form.

handleFormSubmitted(*data, container_id, form_id, dataTableObj*)

Handle the response from the API URL that the form data is POSTed to.

This should either display a success message, or one or more error messages.

Arguments

- **data** (*Object*) – response data
- **container_id** (*string*) – the ID of the modal container on the page
- **form_id** (*string*) – the ID of the form on the page
- **dataTableObj** (*Object*) – A reference to the DataTable on the page, that needs to be refreshed. If null, reload the whole page. If a function, call that function. If false, do nothing.

handleInlineForm(*container_id, form_id, post_url, dataTableObj*)

Generic function to handle form submission with server-side validation of an inline (non-modal) form.

See the Python server-side code for further information.

Arguments

- **container_id** (*string*) – The ID of the container element (div) that is the visual parent of the form. On successful submission, this element will be emptied and replaced with a success message.
- **form_id** (*string*) – The ID of the form itself.
- **post_url** (*string*) – Relative URL to post form data to.
- **dataTableObj** (*Object*) – passed on to handleFormSubmitted()

handleInlineFormError(*jqXHR, textStatus, errorThrown, container_id, form_id*)

Handle an error in the HTTP request to submit the inline (non-modal) form.

handleInlineFormSubmitted(*data, container_id, form_id, dataTableObj*)

Handle the response from the API URL that the form data is POSTed to, for an inline (non-modal) form.

This should either display a success message, or one or more error messages.

Arguments

- **data** (*Object*) – response data
- **container_id** (*string*) – the ID of the modal container on the page
- **form_id** (*string*) – the ID of the form on the page
- **dataTableObj** (*Object*) – A reference to the DataTable on the page, that needs to be refreshed. If null, reload the whole page. If a function, call that function. If false, do nothing.

isFunction(*functionToCheck*)

Return True if *functionToCheck* is a function, False otherwise.

From: <http://stackoverflow.com/a/7356528/211734>

Arguments

- **functionToCheck** (*Object*) – The object to test.

serializeForm(*form_id*)

Given the ID of a form, return an Object (hash/dict) of all data from it, to POST to the server.

Arguments

- **form_id**(*string*) – The ID of the form itself.

jsdoc.fuel

File: biweeklybudget/flaskapp/static/js/fuel.js

fuelLogModal(*dataTableObj*)

Show the modal to add a fuel log entry. This function calls *fuelModalDivForm()* to generate the form HTML, *schedModalDivFillAndShow()* to populate the form for editing, and *handleForm()* to handle the Submit action.

Arguments

- **dataTableObj**(*Object / null*) – passed on to *handleForm()*

fuelModalDivForm()

Generate the HTML for the form on the Modal

vehicleModal(*id*)

Show the Vehicle modal popup, optionally populated with information for one Vehicle. This function calls *vehicleModalDivForm()* to generate the form HTML, *vehicleModalDivFillAndShow()* to populate the form for editing, and *handleForm()* to handle the Submit action.

Arguments

- **id**(*number*) – the ID of the Vehicle to show a modal for, or null to show modal to add a new Vehicle.

vehicleModalDivFillAndShow(*msg*)

Ajax callback to fill in the modalDiv with data on a Vehicle.

vehicleModalDivForm()

Generate the HTML for the form on the Modal

jsdoc.ofx

File: biweeklybudget/flaskapp/static/js/ofx.js

ofxTransModal(*acct_id, fitid*)

Show the modal popup, populated with information for one OFX Transaction.

jsdoc.payperiod_modal

File: biweeklybudget/flaskapp/static/js/payperiod_modal.js

schedToTransModal(*id, payperiod_start_date*)

Show the Scheduled Transaction to Transaction modal popup. This function calls *schedToTransModalDivForm()* to generate the form HTML, *schedToTransModalDivFillAndShow()* to populate the form for editing, and *handleForm()* to handle the Submit action.

Arguments

- **id**(*number*) – the ID of the ScheduledTransaction to show a modal for.
- **payperiod_start_date**(*string*) – The Y-m-d starting date of the pay period.

schedToTransModalDivFillAndShow(*msg*)

Ajax callback to fill in the modalDiv with data on a budget.

schedToTransModalDivForm()

Generate the HTML for the form on the Modal

skipSchedTransModal (id, payperiod_start_date)

Show the Skip Scheduled Transaction modal popup. This function calls `skipSchedTransModalDivForm()` to generate the form HTML, `skipSchedTransModalDivFillAndShow()` to populate the form for editing, and `handleForm()` to handle the Submit action.

Arguments

- **id** (*number*) – the ID of the ScheduledTransaction to show a modal for.
- **payperiod_start_date** (*string*) – The Y-m-d starting date of the pay period.

skipSchedTransModalDivFillAndShow (msg)

Ajax callback to fill in the modalDiv with data on a budget.

skipSchedTransModalDivForm()

Generate the HTML for the form on the Modal

jsdoc.projects

File: biweeklybudget/flaskapp/static/js/projects.js

activateProject (proj_id)

Handler for links to activate a project.

deactivateProject (proj_id)

Handler for links to deactivate a project.

handleProjectAdded()

Handler for when a project is added via the form.

jsdoc.reconcile

File: biweeklybudget/flaskapp/static/js/reconcile.js

clean_fitid (fitid)

Given an OFXTransaction fitid, return a “clean” (alphanumeric) version of it, suitable for use as an HTML element id.

Arguments

- **fitid** (*String*) – original, unmodified OFXTransaction fitid.

makeTransFromOfx (acct_id, fitid)

Link function to create a Transaction from a specified OFXTransaction, and then reconcile them.

Arguments

- **acct_id** (*Integer*) – the OFXTransaction account ID
- **fitid** (*String*) – the OFXTransaction fitid

makeTransSaveCallback (data, acct_id, fitid)

Callback for the “Save” button on the Transaction modal created by `makeTransFromOfx()`. Displays the new Transaction at the bottom of the Transactions list, then reconciles it with the original OFXTransaction

Arguments

- **data** (*Object*) – response data from POST to /forms/transaction

- **acct_id** (*Integer*) – the OFXTransaction account ID
- **fitid** (*String*) – the OFXTransaction fitid

reconcileDoUnreconcile (trans_id, acct_id, fitid)

Unreconcile a reconciled OFXTransaction/Transaction. This removes trans_id from the reconciled variable, empties the Transaction div's reconciled div, and shows the OFX div.

Arguments

- **trans_id** (*Integer*) – the transaction id
- **acct_id** (*Integer*) – the account id
- **fitid** (*String*) – the FITID

reconcileDoUnreconcileNoOfx (trans_id)

Unreconcile a reconciled NoOFX Transaction. This removes trans_id from the reconciled variable and empties the Transaction div's reconciled div.

Arguments

- **trans_id** (*Integer*) – the transaction id

reconcileGetOFX ()

Show unreconciled OFX transactions in the proper div. Empty the div, then load transactions via ajax. Uses [reconcileShowOFX \(\)](#) as the ajax callback.

reconcileGetTransactions ()

Show unreconciled transactions in the proper div. Empty the div, then load transactions via ajax. Uses [reconcileShowTransactions \(\)](#) as the ajax callback.

reconcileHandleSubmit ()

Handle click of the Submit button on the reconcile view. This POSTs to /ajax/reconcile via ajax. Feedback is provided by appending a div with id reconcile-msg to div#notifications-row/div.col-lg-12.

reconcileOfxDiv (trans)

Generate a div for an individual OFXTransaction, to display on the reconcile view.

Arguments

- **ofxtrans** (*Object*) – ajax JSON object representing one OFXTransaction

reconcileShowOFX (data)

Ajax callback handler for [reconcileGetOFX \(\)](#). Display the returned data in the proper div.

Arguments

- **data** (*Object*) – ajax response (JSON array of OFXTransaction Objects)

reconcileShowTransactions (data)

Ajax callback handler for [reconcileGetTransactions \(\)](#). Display the returned data in the proper div.

Sets each Transaction div as droppable, using [reconcileTransHandleDropEvent \(\)](#) as the drop event handler and [reconcileTransDroppableAccept \(\)](#) to test if a draggables is droppable on the element.

Arguments

- **data** (*Object*) – ajax response (JSON array of Transaction Objects)

reconcileTransDiv (trans)

Generate a div for an individual Transaction, to display on the reconcile view.

Arguments

- **trans** (*Object*) – ajax JSON object representing one Transaction

reconcileTransDroppableAccept (*drag*)

Accept function for droppables, to determine if a given draggable can be dropped on it.

Arguments

- **drag** (*Object*) – the draggable element being dropped.

reconcileTransHandleDropEvent (*event, ui*)

Handler for Drop events on reconcile Transaction divs. Setup as handler via [reconcileShowTransactions\(\)](#). This just gets the draggable and the target from the event and ui, and then passes them on to [reconcileTransactions\(\)](#).

Arguments

- **event** (*Object*) – the drop event
- **ui** (*Object*) – the UI element, containing the draggable

reconcileTransNoOfx (*trans_id, note*)

Reconcile a Transaction without a matching OFXTransaction. Called from the Save button handler in [transNoOfx\(\)](#).

reconcileTransactions (*ofx_div, target*)

Reconcile a transaction; move the divs and other elements as necessary, and updated the `reconciled` variable.

Arguments

- **ofx_div** (*Object*) – the OFXTransaction div element (draggable)
- **target** (*Object*) – the Transaction div (drop target)

transModalOfxFillAndShow (*data*)

Callback for the GET /ajax/ofx/<acct_id>/<fitid> from [makeTransFromOfx\(\)](#). Receives the OFXTransaction data and populates it into the Transaction modal form.

Arguments

- **data** (*Object*) – OFXTransaction response data

transNoOfx (*trans_id*)

Show the modal for reconciling a Transaction without a matching OFXTransaction. Calls [transNoOfxDivForm\(\)](#) to generate the modal form div content. Uses an inline function to handle the save action, which calls [reconcileTransNoOfx\(\)](#) to perform the reconcile action.

Arguments

- **trans_id** (*number*) – the ID of the Transaction

transNoOfxDivForm (*trans_id*)

Generate the modal form div content for the modal to reconcile a Transaction without a matching OFXTransaction. Called by [transNoOfx\(\)](#).

Arguments

- **trans_id** (*number*) – the ID of the Transaction

updateReconcileTrans (*trans_id*)

Trigger update of a single Transaction on the reconcile page.

Arguments

- **trans_id** (*Integer*) – the Transaction ID to update.

jsdoc.reconcile_modal

File: biweeklybudget/flaskapp/static/js/reconcile_modal.js

txnReconcileModal (id)

Show the TxnReconcile modal popup. This function calls `txnReconcileModalDiv()` to generate the HTML.

Arguments

- `id (number)` – the ID of the TxnReconcile to show a modal for.

txnReconcileModalDiv (msg)

Ajax callback to generate the modal HTML with reconcile information.

jsdoc.scheduled_modal

File: biweeklybudget/flaskapp/static/js/scheduled_modal.js

schedModal (id, dataTableObj)

Show the ScheduledTransaction modal popup, optionally populated with information for one ScheduledTransaction. This function calls `schedModalDivForm()` to generate the form HTML, `schedModalDivFillAndShow()` to populate the form for editing, and `handleForm()` to handle the Submit action.

Arguments

- `id (number)` – the ID of the ScheduledTransaction to show a modal for, or null to show modal to add a new ScheduledTransaction.
- `dataTableObj (Object / null)` – passed on to `handleForm()`

schedModalDivFillAndShow (msg)

Ajax callback to fill in the modalDiv with data on a budget.

schedModalDivForm ()

Generate the HTML for the form on the Modal

schedModalDivHandleType ()

Handle change of the “Type” radio buttons on the modal

jsdoc.transactions_modal

File: biweeklybudget/flaskapp/static/js/transactions_modal.js

transModal (id, dataTableObj)

Show the Transaction modal popup, optionally populated with information for one Transaction. This function calls `transModalDivForm()` to generate the form HTML, `transModalDivFillAndShow()` to populate the form for editing, and `handleForm()` to handle the Submit action.

Arguments

- `id (number)` – the ID of the Transaction to show a modal for, or null to show modal to add a new Transaction.
- `dataTableObj (Object / null)` – passed on to `handleForm()`

transModalDivFillAndShow (msg)

Ajax callback to fill in the modalDiv with data on a Transaction.

transModalDivForm()

Generate the HTML for the form on the Modal
